The Mining Journal RAILWAY AND COMMERCIAL GAZETTE.

FORMING A COMPLETE RECORD OF THE PROCEEDINGS OF ALL PUBLIC COMPANIES.

No. 716.---Vol. XIX.]

LONDON, SATURDAY, MAY 12, 1849.

PRICE 6D.

EXTENSIVE IRON-WORKS FOR SALE.
UPSET PRICE FURTHER REDUCED TO £45,00

TO BE SOLD, BY PUBLIC ROUP, within the Royal Exchange Sale Rooms, GLASGOW, upon Wednesday, the 13th day of June next, at One o'clock afternoon (if not previously disposed of by private bargain),

THE BLAIR IRON - WORKS,
belonging to the Ayrabire Iron Company, situated in the parish of Dairy and county of Ayr, including FIVE BLAST-FURNACES, with TWO BLOWING-ENGINES, fit for these and additional furnaces, manager and workmen's, houses and stove, together with a large extent of MINERAL FIELDS, held under most favourable leases, producing iron-stone of the best qualities, Coal, Limestone, and Fire-clay, with Pits, Steam-Engines, and necessary appurtenances for carrying on the works on an extensive scale; also the adioning MALLEABLE IRON-WORKS,
So far as erected—all having a connection with the Glasgow and Ayr Railway, and as more fully described in former advertisements.

There is a large stock of fronstone on the ground, which may be got at a valuation. For particulars apply to Mr. Biggart, at the works; W. D. Starling, Esq., 13, Changew.—Glasgow, May 10, 1849.

O BE SOLD (CHEAP), a 40-horse HIGH-PRESSURE HORIZONTAL STEAM-ENGINE, quite new; cylinder 24 inches diameter, stroke et, mounted upon a strong metal box frame.—Apply to Mr. Matthew Smith, Sylvester orks, Sheffield, where the engine may be seen.

Works, Sheffield, where the engine may be seen.

CORNWALL—TYWARNHAILE MINES.

IMPORTANT AND VALUABLE COPPER MINES TO
BE LET, BY PRIVATE CONTRACT, comprising the extensive SETTS formerly
UNITED HILLS,
SOUTH TOWAN.

WHEAL CHARLES, and
SOUTH TOWAN.

WHEAL FANCY.

belonging to the Duchy of Cornwall, in the parish of SAINT AGRES.—These mines having been surrendered to the Duchy by the late lesses, during the extreme pressure of the latter part of the year 1847, have since been placed in good working order, and are yielding large and increasing returns. They are now to be leased, at a moderate rate of dues, for a term of 21 years.

An arrangement can be made for putting the lessess of the Tywarnhaile Mines in possession of the adjoining setts of Wheal Sparrow, West Wheal Sparrow, Basset's United Hills, Wheal Clarence, and Wheal Lydia, the property of the representatives of the late John Basset, Esq.

Proposals will be received at the Duchy of Cornwall Office, Somerast House; and any

session of the adjoining setts or wheat Spartow, trest the adjoining setts of wheat Lydia, the property of the representatives of the late John Basset, Esq.

John Basset, Esq. and the Duchy of Cornwall Office, Somerset House: and any further information may be obtained by application there, or to R. Taylor, Esq., Falmouth. Duchy of Cornwall, Somerset House, Feb. 20, 1849.

Duchy of Cornwall, Somerset House, Feb. 20, 1849.

COAL MINES IN FLINTSHIRE.—The TRYDDYN LODGE ESTATE TO BE SOLD, BY PRIVATE TREATY, OR LET ON LEASE. It consists of about 70 acres of good LAND, all in a ring fence, a good and commodious HOUSE, with a large GARDEN, COACH-HOUSE, STABLES, and all necessary and complete FARM BUILDINGS; together with TWENTY-ONE STONE-RULLT COTTAGES for workmen, erected on the estate.

Agood turnpike-road—that from Chester to Ruthin—passes through the property, and a branch of the Mold Railway (which runs into the Chester and Holyhead Railway, and is now about to open) will come within a quarter of a mile of the estate.

The Tryddyn Lodge Estate adjoins the Coad Talon Iron-Works and Coal-works. The mines are wholly unworked; but closely adjoining workings at Coed Talon on the south side, and those of the Frank Farm Colliery on the north side, fully warrant the conclusion that all the seams of coal, for an aggregate thickness of 44 feet, within 160 yards of the surface. These coals (especially the Two-yard, Brassey, Main Coal, and those below) are of very superior quality, and in high esteem for house or smith's use, smelling, or coking. If is also most satisfactorily concluded that several beds of ironstone, of very excellent quality, lie entire under this property; four workings thereof form an aggregate thickness of 40 inches.

Apply to Messrs. Harper and Parry Jones, solicitors, Whitchurch, Salop.

TO IRON AND TIN-PLATE MANUFACTURERS.

TO IRON AND TIN-PLATE MANUFACTURERS

TO BE LET, OR SOLD, the NEW LAYS IRON and TIN-PLATE WORKS, situated at BROCKMOOR, within 3 miles of Stourbridge, on the banks of the Stourbridge, and at the mouth of the Stourbridge Extension Canals, and in the centre of the Kingswinford Coal-field.

The works are in excellent order, and well adapted to the manufacture of Ralls, Bars, Bolier-plates, and every description of Merchant Iron.

If sold, the purchase-money may, if required, be paid by instalments, or a considerable portion thereof may remain on mortgage for a period of years.

For further particulars apply to Mr. Henry Corser, solicitor, Stourbridge.

TENDERS FOR WELSH COAL AND NORWAY TIMBER.

-TENDERS may be FORWARDED to ME, on or before the 1st proximo, for SUPPLYING TWO THOUSAND TONS, more or less, as may be required, of

outfiling Two Thousand Tons, more or less, as may be required, of
WELSHOOD TONS, more or less, as may be required, of
the best quality for Steam-Engines, to be DELIVERED at WEST CARADON, GONAMENA, and WHEAL MARY CONSOLS MINES, between Midaummer, 1849, and Midsummer, 1859, in about equal quantities monthly, and so that the mines shall be
kept constantly supplied; in default of which, and also of the quality being the best, the
cost above the countract price of obtaining a supply elsowhere to be charged to the contractors. The mode of payment to be yacceptances, at three months, from the times
(once in two months) of auditing the accounts.

(once in two months) of auditing the accounts.

TENDERS may also be FORWARDED to ME, on or before the lat proximo, for SUP-PLYING the following Mines—viz.: WEST CARADON, GONAMENA, CRADDOCK MOOR, and WHEAL MARY CONSOLS, for 12 months, from Midsummer next, with NORWAY TIMBER, half Dram and half Longsound, of good quality and average lengths, to be delivered at the respective mines, in such quantities as may be required, and when required, and to be charged at the measurement on which the duty has been paid. Should the agents not approve of the quality of any timber sent in, the contractors to remove the same; and, at the option of the respective adventurers, either replace it by an article of approved quality, or submit to a reduction from their bills of the amount of difference between the contract price and that at which the adventurers may obtain a supply from some other party; also the amount of the like difference to be deducted from the contractors in this in respect of timber purchased elsewhere, in consequence of the contractors not sending in supplies when and as required. Payment for timber by acceptances at three months, as for coal above. Any mine may be tendered for separately, and either for coal or timber. Liskeard, its of 5th month (May), 1849.

TAMES ROYDELL, LAND, MINE, AND MACHINERY

JAMES BOYDELL, LAND, MINE, AND MACHINERY
VALUER, AND AGENT,
No. 54, THEEADWEEDLE-STREET, LONDON,
HAS TO DISPOSE OF
A PATENT RIGHT for BUILDING VESSELS with IRON, on a principle which com-

bless increased strength with greater economy of manufacture.

Also, ONE for the CONSTRUCTION of IRON ROOMS, on a like principle. A specimen of this mp be seen as a roof covering one of the retort houses of the Birmingham and Staffordshire Gas Company, by permission of Mr. Clift, the engineer, at the works.

Also, DNs for IRON JOISTS and RAFTERS, and for a plan of Joining large plates and sheets, at two

Also, ONE for the AMALGAMATION of STEEL and IRON—in the progress of the manufacture of the latter, by which a great saving may be effected in the cost of making

edged tools.

The LEASE of a very celebrated FOUNDRY and ENGINEERING ESTABLISHMENT, on the River Dee, complete, with fixtures, machinery and tools, in working order, and teady for any parties to embark at once on building first-class from steam-vessels, and marine and locomotive engines.

The above will be found weather the attention of any parties destring to invest money

The above will be found worthy the attention of any parties desiring to invest money a profitable business, as they will be disposed of upon terms which will ensure an unisual return to the purchasers of them.

Also, SOME COAL and RONSTONE MINES, FREESTONE QUARRY, and a large FREEHOLD ESTATE.

Also, STEAM-ENGINES and MACHINERY, of all descriptions, and which he is enabled to offer at very moderate prices.

Also, SHARES in a well-known valuable SLATE QUARRY, in CARNARVONSHIRE.

Also, SHARES in, or the whole of, a GAS-WORK, which supplies exclusively a population in Shropshire, and which can be greatly extended.

Particulars of the above may be had, upon application, at 54, Threadneedle-street.

TO ENGINEERS, BUILDERS, AND ARCHIFECTS.

JAMES BOYDELL, 54, THREADNEEDLE-STREET, having been a very large manuacturer of machinery and irregular shaped irro, and having accomplished the rolling of ome descriptions of the latter, thought by many to have been impracticable, will be happy ASSIST any ENGINEERS, SHIPBUILDERS, and ARCHITECTS, in the planning of edutials of what IRONWORK they may have occasion for, or bringing to perfection my invention in machinery, as well as procuring such materials for the purpose as they asy require.

THE STEAM - ENGINE. — W. BROTHERTON & CO. beg to CALL the ATTENTION of ALL PARTIES EMPLOYING STEAM-POWER their PATENT PURIFIED OIL for the ECONOMICAL WORKING of the STEAM-NGINE and other MACHINERY.

The adoption of its use effects a saving of 25 per cent. on the quantity required for luciation over any other oil; and its properties are such as to greatly preserve the beargs of machinery in general. A trial will prove the fact.

4TENT OIL PACTORY, HUNGERFORD WHARF, CHARING-CROSS, LONDON.

WARRANTED SAFETY FUSE.-W. BRUNTON & CO. Y beg to inform Mine Agenta, Contractors, and Merchants, that having elself Machinery for the MANUFACTURE of the ABOVE ARTICLE, they are offer FUSE of a very superior quality, and at considerably reduced prices. W. B. & Co. can SUPPLY FUSE in ANY LENGTHS that may be required. Penhellick Fuse Factory, Pool, Traro, Cornwall.

TESTIMONIALS.

We, the undersigned, hereby bear our testimony to the excellence of the Safety Fuse, anulactured by Messrs. Brunton and Co. We have had it in use in our mines; and, for sufficient trial, find it to be fully equal to any Fuse we have ever used:—

STEAM TO INDIA AND CHINA, VIA EGYPT.—Regular MONTHLY MAIL (steam conveyance) for PASSENGERS and LIGHT GOODS to CEYLON, MADRAS, CALCUTTA, PENANG, SINGAPORE, and HONG-KONG. LEAM 1U INDIA AND CHINA, VIA EGYPT.—Regular MONTHLY MAIL (steam conveyance) for PASSENGERS and LIGHT GOODS to CEYLON, MADRAS, CALCUTTA, PENANG, SINGAPORE, and HONG-KONG. THE PENINSULAR AND ORIENTAL STEAM NAVIGATION COMPANY BOOK PASSENGERS and RECEIVE GOODS and PARCELS for the ABOVE PORTS by their steamers—starting from Sonthampton on the 20th of every month; and from Sues on or about the 10th of the month.

BOBIAY.—Passengers for Bombay can proceed by this company's steamers of the 29th of the month, to Malia, thence to Alexandria by her Majesty's steamers, and from Suez by the Bonourable East India Company's steamers.

MEDITERRANEAN.—MALTA—On the 20th and 20th of every month. Cosstantinopes.—On the 20th of the month.

SPAIN AND PORTUGAL.—Vigo, Oporto, Lisbon, Cadiz, and Gibraitar, on the 7th 17th, and 37th of the month.

For plans of the vessels, rates of passage-money, and to secure passages and ship carge, apply at the company's offices, No. 122, Leadenhall-strest, London; and 57, High-street, Southampton.

INDURATED AND IMPERVIOUS STONE, CHALK, &c. NDUKATED AND IMPERVIOUS STONE, CHAIR, &c.

—AGENTS, with capital, are WANTED in all TOWNS to SUPPLY (under British and Foreign Patents) the great demand for HUTCHISONISED MATERIALS—hard as granile, impervious to moisture, vermin, &c.; the chespest and most durable for all buildings, hydraulic, paving, monumental and decorative work.—The profits are large. Apply to HUTCHISON & CO., East Temple Chambers, London, or Tunbridge Wells, Kent, stating name, address, and capital at command.

N.B.—Houses cured of damp. The produce of soft stone quarries, chalk, plaster of Paris, wood, pasteboard, and all absorbent materials indurated to resist frost, vermin, &c. LICENCES GRANTED.

RIDER'S RAILWAY BRIDGE

—This BRIDGE, BUILT wholly of IRON, will be FRECTED by the PATENTS on the following terms:—

A BRIDGE, of 150 span, for a double track railway, bread gauge—Price £2000.

A BRIDGE, of 100-fost span, same dimensions—Frice £1000.

These prices are exclusive of abutments or plers.

ROADWAY BRIDGES at a reduction on cost of from one-half to two-thirds.

Apply to Mr. S. MOULTON, Patentee, Bradford, Wilts, or to Mr. Howard Jacobson, Suffolk-lane, Themes-street, London.

or to Mr. Howard Jacobson, Suffolk-lane, Thanes-street, London.

CUNNINGHAM AND CARTER'S NEW SYSTEM OF RAILWAY PROPULSION.—Railway Directors. Engineers, and the public generally, are invited to examine this system, which may be JiEWED on Mondays, Wednesdays, and Saturdays, from half-past Eleven to Three o'clock, at Ingram's Manufactory, 29, CITY-ROAD, near Finsbury-square.

The following is an estimate of the daily expense of working a double line of 50 miles long, during a period of 10 hours, with trains starting from each terminus every half hour—six trains always running on the line:—Coals for five stationary engines, of 100-horse power each at 5 lbs. per horse—power per hour each (say, 11 tons, at 14s. per ton).

Wages—Enginemen, with relief, 10 at 6s. £3 0 0

Wages—Enginemen, with relief, 10 at 6s. £3 0 0

Cloaners ditto 10 at 4s. 2 0 0

Cloaners ditto 10 at 2s. 6d. 1 5 0

Drivers ditto 12 at 5s. 3 0 0

Guards ditto 12 at 5s. 3 0 0

Repairs of engines, with depreciation, &c., at £300 per annum, each ×5=1000.

Per annum—daily proportion £15 0

Total. £30 0 0

Total....£30

Forty trains, at 15s, per train=£30, being a fraction over 3jd. per train per mile opendent of a saving of one-third of the present expense in the maintenance of way.

CWMBRAIN PATENT IRON REFINERY.—The PROPRIETORS of IRON FORCES and MILLS are respectfully INVITED to MAKE TRIAL of Mr. BLEWITT'S REFINED IRON, or METAL, PREPARED by a

MAKE TRIAL of Mr. BLEWITT'S REFINED IRON, of METAL, PREPARED by a NEW PATENT PROJESS,
whereby the IRON is completely FREED from the IMPURITIES CONTRACTED in the BLAST-FURNACE, and, by indicious mixtures, rendered applicable to every kind of manufacture. Heretofore, the metal usually sold in the market has been produced from he worst pigs, scraps, and refuse of some particular blast-furnace, or set of furnaces, without any mixture, or any regard to quality, or the purpose for which it might be required. The PATENT METAL is PREPARED ON SYSTEM, and TO ORDER, for any of the following purposes:—

1. For BOILER and TANK-PLATES.
2. For TIN-PLATES, commonly called COKE-PLATES.
3. For STRONG CABLE BOLTS, RIVET, and ANGLE HON.
4. This COMPOND PUDDLED, beat under the hammer into a bloom, reheated, and rolled into a 6 or 64-incl bar, makes TOPS and BOTTOMS for FLANCH and OTHER RAILS, of very superior quality, and attended with loss waste than any other kind of iron used for that purpose. It is also well adapted for mail-rols, horse-shoes, and for other ordinary uses of the blacksmith.

The PATENT METAL is marked with a squirrel, and the initials "B. J. B.,"

The PATENT METAL is marked with a squirrel, and the initials "R. J. B.," and is to be had only at the "Cwmbrain Iron-Works," near Newport, Monmouthshir

A LENT TOUGHENED CAST-IRON.—Messrs. GARDEN and MACANDREW beg to call the attention of Architects, Builders, Engineers, Ironfounders, &c., to the ABOVE DESCRIPTION OF IRON (Mr. Morries Striling's Patent), which, after numerous trials, experimental and practical, is found greatly to exceed all other cast-iron in tensile and transverse strength, as well as in resistance to crushing forces. Several of the most extensive ironmasters have been licensed, and from them, or their brokers, the patent iron can be procured.

Messrs GARDEN & MACANDREW have always a STOCK of this IRON in PIGS, and are ready to EXECUTE ORDERS to ANY EXTENT, on the shortest notice.

INSCRIPT DESTRUCTS (COURT, MAY, HAVE, AND IN THE MATTER OF SIR FARNCIS CHARLES KNOWLES, BART.—HARKRUSTEY AND IN CX.—In this case a very important question arose. A rule had been abitalued at

IN THE MATTER OF SER FARRES CHREEK KNOWLES, BARY.— HANKRUPTCY AND INDIVINCY.—In this case a very important question area.—A rule had been obtained at the instance of Sir Robert Price, an several parties, to show cause why considerable property in the Glamorganahire from and Coal Works should not be sold by the provisional assignee, under a vesting order made by the court on a creditor's petition in 1842, when Sir F. C. Knowles was a prisoner for debt.

Mr. Nichols appeared for Sir R. Price; Mr. Sargood for Sir F. C. Knowles; and Mr. Caarten represented a trade assignee in bankruptcy.

A preliminary objection was raised to the Jarisdiction of the court. It appeared that the vesting order was made in September, 1842, and a fast in bankruptcy was issued in July, 1847, under which Sir F. C. Knowles had obtained his certificate. The property in respect to which the application was made, related to the Glamorganshire from and Coal Works, in which Sir F. Price, Sir F. C. Knowles, and B. Long, Esq., were partners, on a capital of 42,000. The point was, whether this court could order asias of the interest of Sir F. C. Knowles, and the non-tense of Sir F. C. Knowles, and the substantial of the case in this court. No schedule had been filed by Sir F. C. Knowles, and also the five case in this court. No schedule had been filed by Sir F. C. Knowles, and also the five case in this court. No schedule had been filed by Sir F. C. Knowles, and also the five case in this court. No schedule had been filed by Sir F. C. Knowles, and also the five case in this court was the partnership which had been formed; but Sir Robert Price objecting, hence arose the present application.

The point was discassed by Mr. Sargood and Mr. Caarten against the jurisdiction of the court, and by Mr. Nichols in favour of it.

Mr. Commissioner Law considered it an important question. It was a new one, and his impression was, that there having been no day applicated or enforce as 61 the court any irrisdiction after a fat issued?

His Hosoica retired to con

issued?

to consider the point, and on his return gave his reasons at som
m was, that the jurisdiction of the court was gone; but, as the
portance, he would allow it to be opened, if the parties required

further discussion.

The learned Commissioner mentioned, in the course of his observations, that the clause was copied from the act which he (Mr. Commissioner Law) prepared in the year 1826, and additions were made with regard to vesting orders and applications by debtors, as well as their creditors. There was some ambiguity in the expression, which was easily accounted for by the haste in which the Act the court now administered (1 and 2 Vic.) was prepared from the Act he had drawn. If he had been correctly informed, the Act was altered in about 24 hours: and, considering the expedition used, he had often expressed his surprise that it had been done so well.

The court named the 17th inst. if it should be deemed advisable to bring the matter again under consideration, if being the impression of his Honour that his jurisdiction was gone for the reasons stated.

NISTER DALE IRON COMPANY.

VICE-CHANCELLOR'S COURT, MAY 8.

A motion was made in this case by Mr. J. Bally, to confirm a special report made by Master Farrer, under the Winding up Act of 1848, approving of a compromise between the official manager of the company and Mrs. Hagles, the wislow and executive of the late Rev. Mr. Hughes, who had held 268 shares in the company. The terms of compromise, which were the payment of 2000t, by instalments to meet present liabilities, and a covenant to pay a further sum of 1000t if required for future calls, which was to be a primary charge on the tostator's estate, were approved of by all parties.

His Honour (Knight Bruce) made the order confirming the report.

CALIFORNIA.

NEW YORE, Apail 17.—Recent accounts, however confirmatory of the fact that gold is found to a considerable extent in California, are equally calculated to dissipate the ideas which some have entertained as to the effect of these new discoveries upon the currency, and to establish also the fact that its acquisition is a work of severe toil, requiring submisand to establish also the fact that its acquisition is a work of severe toil, requiring submission to suffering, and privations much more endurable to the excited imaginations of the aspirants for wealth at a distance than they are in reality; and hence the conclusion is obvious, that a large proportion of the emigrants who have gone thither will, from necessity, not continue the laborious occupation for any length of time, but as they find each for himself other means of living, will adapt themselves to business more congenial to their former habits. But supposing the larger part to engage in gold digging, it would appear from the accounts considered most reliable, that the average per diem compensation will not be found sufficient to satisfy their expectations, and will diminish as the ground is gone over. The latest accounts place the whole amount of gold collected at from three to five millions of dollars; an estimate more likely, with the disposition to exaggerate which appears to exist on the Pacific and elsewhere, to be too large than too small; and to collect his sum there have been from 5000 to 10,000 men engaged for unwards of alx months.

Assuming the smallest number, say 4000 men, to have been employed for 180 days, as the statement herotofore informs us that many persons get \$100 per day, and none less than an onnee, it is fair to take \$20 per day as the average result of indidual inbour. The aggregate amount of the six months would, upon this basis, be over 14,000,000, some 10,000,000 over the amount of the lighest estimate, so that the calculations and statements do not match, though it may be impossible at present to say where the error lies. Upon the genoment of 4000,000 as the maximum, the average less than \$6 per day, and flowever good refindention tulk may be impossible at present to say where the error lies. Upon the genoment of 4000,000 as the maximum, the average less than \$6 per day, and flowever good refindention tulk may be impossible at present to say where the error lies.

Loon the amount of \$600,000 as the maximum, the average is less than \$6 per day, and the amount of \$600,000 as the maximum, the average is less than \$6 per day, and the endurance of hardship and privation by people accustomed to both, when the expenses of going and returning, and subsistence on the ground, to say nothing of the hazards, are taken into account, it must be looked upon as a very moderate recompense, and one which will not tend to promote the emigration of sensible men to California.

A Mr. Wethered, of Baltimore, is so far the only actual gold digger who has reported himself safe back again from the mines. He estimates the amount of gold raised up to the beginning of December, at \$4,000,000. He reached a distance of \$50 miles from San Francisco, up the Americano, which is farther than any American had gone before, and saw the smoke of what he believed was a large roleano, some 40 or 50 miles distant. He passed large numbers of persons at the different placers, some of whom had been auccestul, and many so unsuccessful that they preferred returning to San Francisco and working for wages. A Mr. Downes, of Massachuetts, who went out in command of a company of adventurers from that state, after reaching Panama, and stopping there three days, concluded to abandon his journey, and returned with the greater part of his company last week, in the Northerson. This gentleman has favoured me with a narrative of what he learned and experienced, and his information, though not so flattering as others, is perfectly reliable.

learned and experienced, and his information, though not so flattering as others, is perfectly reliable.

He says he left 1500 Americans at Panama, some of whom had been waiting conveyance to California for three months, besides 500 more at Goagona, and 500 more at Chagres. The means of many were exhausted, and they were reduced to extremities. A meeting had been held to consider the possibility of travelling thence by land, through Central America and Mexico, but the project was found impracticable for want of reads, water, and provisions. Some were coming back to New Orleans, to endeavour to resume their journey from that point by one overtand routes; but the majority held on to the hope of geiting passage by water to San Francisco, though it was generally believed that the California would not be able to return to the istimus very soon—that her crew would all desert immediately on reaching San Francisco. There was much sickness at Panama, as well as on the way across the istimus—dysentry, brain fever, &c., &c. The latest dates from that place to San Francisco come down only to December. Two British gentlemen, who left at that time, came passengers in the Northernen. The journey to the gold mines had completely disenchanted them. They calculated that as much money may be earned by working here for 81 aday, as by digging on the Sacramento. The average yield per man they found not more than 85 a day, and the cost of living six! There were many, certainly, who did better, but this, in their judgment, is a fair average.—Correspondent of Birmans/bears—Journal.

IBON HOUSE FOR CALIFORNIA.—An extensive iron warehouse has just been completed by Messrs. E. T. Bellhouse and Co. of this city, for Messrs. Pym and Roberts, of Liverpool, who are about to establish a branch of their business at San Francisco. The dimensions of the metallic edifice are as follow:—Extreme length, 69 feet; width, 24 feet: height to the under side of the eaves, 10 feet; height to peak of roof, 17 feet. There is an iron division 15 feet from one end, and the smaller compartment is intended to be used as a dwelling house or office. A strong timber frame forms the foundation, on the top edge of which are screwed down moulded base plates of cast iron. The sides, ends, partition, and roof are made principally of wrought-iron of the T section, set at distances of about 5 feet apart; to these are bolted sheets of iron one-eighth of an inch in thickness, which are joined to each other at lap joints by bolts. The whole of the doors and shutters are made of wrought-iron, and the windows, skylights, ventilators, rain pipes, and gutters, are of cast-iron. We believe that the entire structure has been fitted and fixed up in a fortnight. It is now at a yard in Bewington Bush, Liverpool.—Manchester Examiner.

Universal, Live Assurance Company.—The annual general meeting of

Devington Bass, Liverpool.—Manchester Examiner.

Universease, Liver Assurance Company.—The annual general meeting of shareholders took place on Thursday, at the offices of the company, King William-street.—The report presented to the proprietors was highly satisfactory: from the estimated amount of surplus, after providing for all the liabilities of the society to the 31st Dec. last, the board recommended that the sum of 139,1211. 16s. 8d. be declared the divisible profits of the society for the last five years; that one-fifth, or 27,8241 7s. 4d. be divided between the policy holders and the shareholders—three-fourths, or 20,8681. 5s. 6d. to the former, and one-fourth, or 69561. 1s. 10d. to the latter; that a reduction of 42½ be deand one-fourth, or 6956. Is. 10d. to the latter; that a reduclared as the current annual premium of all policies taken term of life on the participating scale before 9th Jan., 1844.

term of life on the participating scale before 9th Jan., 1844.

EASTERN COUNTES RALWAY.—At the meeting of shareholders, on Thursday, the report of the committee of investigation was adopted, with the exception of the recommendation for the Norfolk amalgamation, which was carried by a show of hands, but upon which a poll was subsequently demanded. Owing to the storm of disapprobation against them, the directors announced their intention to resign in a body, holding office only until their successors shall be appointed; and a motion by Mr. Cash was then carried, thus for the purpose of electing eight directors in every respect suitable, the investigation committee should select 30 names from amongst the proprietors holding from 1000t to 10,000t stock each; and that from these, together with the committee, making in all 38 names, the nomination should take place.

INSTITUTION OF CIVIL ENGINEERS.

INSTITUTION OF CIVIL ENGINEERS.

Max 1-8.—Josava Fred, Eq. (Vice-President), in the chair.

At the first of these meatings, the monthly ballot took place, when the following candidates were elected:—W. Wilson and R. Peacock, as members; and W. E. Bott, W. Sowerby, jun., and Capt, H. James, R. R., as associates.

The discussion on Mr. Crampton's paper, "On the Construction of Locomotive Engines," was continued through both these evenings. The same tone of argument was kept up, and numerous instances were adduced supporting the views of both sides, but without arriving at any definite result, other than that it was desirable in all engines to lower the centre of gravity, in order to establish a great angle of stability, and to arrive at a ratio between the circumference of the driving wheel and the cubic content of the cylinders, such as whilst the greatest speed might be maintained, with an economical consumption of fuel, every facility should be afforded for starting rapidly, which was a point of importance on lines running frequent trams. On the one hand it was argued, that small driving wheels were essential for quick starting; on the other hand it was contended, that with a given amount of evaporating surface in the boiler, the tractive power would be the same under all circumstances at the periphery of the driving wheel, provided a given relative proportion existed between the cubic content of the cylinder and the circumference of the driving wheel, and that large wheels reduced the wear and tear. The long disposed of question of the stability of the long boiler engines was again cursorily touched on and disposed of. The diminution of the wear and tear of the sides of the brasses of the engines, having the driving-wheels behind, and the greatest weight apon tie extremities, leaving a comparatively light load on the centre wheels, was adduced as a proof of their stability—an engine of that kind having run 25,000 miles without any appreciable lateral wear; whereas an ordinary engine on the same railway, had w

the same railway, had worn away a thickness or a quarter of an inch whist running the same distance.

A short paper was read, describing a kind of Permanent Way, which had been somewhat extensively laid down on the Lancashire and Yorkshire and other railways, in the north of England, by Mr. Hawkshaw, M.I.C.E. The principle was that of a bridge rail, weighing 75 lbs. per yard, placed upon continuous longitudinal timber bearing; and the novelty consisted in having at each joint a malleable iron plate chair, with a projection on the upper surface, fitting within the interior of the rail, and the flanches, which were 14 in. long by 8 in. wide, and \(\frac{1}{2} \) in. in thickness, attached to the rail by rivets in such a manner as to fix them firmly together, and yet to allow for the expansion and contraction caused by the variations of temperature.

The details of the arrangement were very simple and complete, and it appeared to succeed perfectly, as in an extent of 20 miles of railway so laid, over which numerous heavy trains had raw daily, at considerable speed, for the last year, only three rivet heads were found to have been knocked off when recently examined.

cently examined.

The paper announced to be read at the next meeting of Tusday, May 15, was "On the Theory of Transverse Strain of Cast-iron Beams," by W. T. Doyne, Assoc. Inst. C.E.

INSTITUTION OF MECHANICAL ENGINEERS.

INSTITUTION OF MECHANICAL ENGINEERS.

The general meeting of members was held, as usual, at the Philosophical Institution, Birmingham, at which the attendance was considerable—more than ordinary interest having been excited in consequence of the new president, ROBERT STEPHENSON, Esq., taking the chair for the first time. Immediately after having taken his seat—

The PRESIDENT rose, and remarked that in opening the business of the meeting, he must be allowed to tender his sincere thanks for the distinguished privilege they had conferred upon him by electing him to the office of president. He highly prized the honour, and would endeavour to prove himself worthy of it, by attending with diligence and energy to the interests of the institution. In undertaking that duty, it was not merely because he delighted in mechanical pursuits, vus it was not merely because he delighted in mechanical pursuits, vus it was not merely because he delighted in mechanical pursuits, vus it was not merely because he delighted in mechanical pursuits, vus it was not merely because he delighted in mechanical pursuits, vus it was not merely to say that he should be doing honour to the departed. He considered it necessary to say that he had undertaken the duty not without some apprehension that from a want of energy ou the part of the members, the fate of all former institutions of the kind—failure—might also be the ultimate end of this. It was a remarkable fact, that in a country like Great Britain, whose wealth and power were so closely connected with the development of the mechanical arts and sciences, hostitutions like their own should fail to reach a higher standard than they did. Astronomers, geologists, physiologists, and botanists extended and maintained their societies, yet nothing but languidness and inactivity characterised the pursuit of those arts and sciences on which the nation's wealth absolutely depended. This was the more remarkable, because the country stood pre-eminent in mechanical ability. He did not say so in any spir

IMPROVED RAILWAY CHAIRS AND SWITCHES.

IMPROVED RAILWAY CHAIRS AND SWITCHES.

It will be remembered that this subject was introduced at the last meeting, and excited considerable interest. Mr. BAINES, the inventor, was present on this evening, and gave a further explanation of his invention. The peculiarity of the chairs consists in an arrangement whereby the joints are prevented from rising or getting out of line, and the rails from driving forward. To effect these objects the outer jaw of the chair fits close up to the under side of the head of the rails, but the inner jaw is only of sufficient height to clip the bottom flanch, and the rails is not fixed by a key, but by a square wrought-iron dowel pin, which is passed through a hole in the outer jaw of the chair, and a corresponding notch in the end of each rail. This pin has a large flat head, and under the head is placed a wrought-iron plate, 9 in. long, which fits close up to the head of the rails on the inner side, and rests on the chair. A square cotter is then driven vertically through the outer end of the dowel pin, which draws the whole firmly up to the outer jaw of the chair. The wrought-iron plate is \(\frac{1}{2} - \text{inch} \) thick in the middle, tapered to the ends, and slightly cambered, and is sprung flat by driving the cotter, which is made long enough to drive through the bottom of the chair into the sleeper, and serve as the spike on the outer side of the chair. A slot is made in the upper part of the cotter to allow the cottor being drawn out when required. The pressure of the wheels has no tendency to loosen the fixing of the rails in the chair, as the outer jaw fits close to the head of the rails, while the bottom flanch is firmly clipped by the inner jaw. The dowel pin does not receive any of the pressure of the wheels, but holds the rails against the outer jaw. It also prevents the rails from raing at the joint, and from driving ferwards. The effect of the long plate under the bead of the dowel pin is to connect the two rails stifly together, so as to prevent the workin

AN EXPRESS LOCOMOTIVE.

The SECRETARY then read a paper by Mr. Weallens, of Newcastle, which was accompanied by drawings. The engine was manufactured by Messrs R. Stephenson, and Co., for the York, Newcastle, and Berwick Railway. It had an inside cylinder with a crank axle and six wheels, with inside bearings for the crank axle, and outside bearings for the leading and trailing axles, and the valves were placed on the outer side of the cylinders, instead of the inner side as usual. is the otter size of the cylinders, made a few remarks, observing some advantage in detail in the arrangement of the engine.

RAILWAY WHEELS.

The Chairman then called upon Mr. Herry Smith, of West Bromwich, to explain the principle of his new solid wrought-iron wheel, one of which was exhibited to the meeting, together with numerous drawings. The paper was contributed at the request of the Council of the Institution, and the explanation of his invention was accompanied by tables of the results of experiments made.

to ascertain the resistance of the atmosphere to apoke and disc wheels, and an appendix of accidents resulting from deficitive wheels—Ms SMITE introduced the subject of his pape by referring to the apresent made of making spoke wheels, in order to contrast it with his invention, and then proceeded to explain the media operatud of the improved manufecture. Briefly the method employed is this:—In the first place, a straight bar of hammared or rolled iron is taken, about four inches wide, and sufficiently long to form a hoop of such a diameter as is most suitable to form the intended wheel. Other pieces of bar iron, laid flat and close together, and cut in lengths to the same circle as the hoop, are then taken to form the base of a "pile." The hoop is then pile cad upon this foundation and filled with scrap iron. The whole is then pile into a reverberatory, or heating furnace, and when at the proper heat, is hammered to form a mould; the face of the hammer is recessed in such a shape as to form an approximation. to the shape of one side of the fluished wheel, but of a smaller diameter, the anvil face is flat. Two of these moulds are then put together, back to back, heated in a similar way, and hammered between tools of the same form and size as the finished wheel; but these tools sombrace only a segment to all the state of the state of the same form and size as the finished wheel; but these tools embrace only a segment tools of the form of the finished wheel. The wheel is then put into an annealing furnace, and planished between similar tools of the form of the finished wheel. The wheel for most heat for the type of the wheel, and thus in all cases ensure a clean wearing surface and a compound character of fibrous and granulated iron, which it is believed no other present system of making wheels affords—The paper having been read, the Cirateman said he thought that the thanks of the meeting were due to Mr. Smith for his very interesting paper, and he therefore moved that they should be voted to him. The motion was

CONSTRUCTION OF PERMANENT WAY.

The Secretary then read a paper contributed by J. W. Hoby, of Brighton, on this subject. This was an elaborate paper, in which the writer, by analysing examples of existing modes of construction, attempted to arrive at a practical conclusion as to the best method. The conditions required, and with a view to which the deductions were made, consisted of the following:—Sufficient platform or bearing surface on the ballast, to prevent the whole road from being crushed down into the ballast. Sufficient bearing surface of the various parts, one on another, to prevent their crushing into each other. Sufficient cross ties to secure uniformity of guage between the two rails composing one line of railway. Sufficient ade stiffness in each rail. Sufficient strength, quality, and shape of materials, to prevent their crushing into themselves. And economy and simplicity of construction.

The Charkman moved that the thanks of the meeting be given to Mr. Hoby, for his interesting communication, which were accordingly passed.—Some discussion

The Chairman moved that the thanks of the meeting be given to Mr. Hoby, for his interesting communication, which were accordingly passed.—Some discussion then arose as to the sufficiency of the wearing surface of rails, and to the decay of the permanent way. With reference to the last subject, the Chairman observed that on the old railways, which had been opened 12 or 14 years ago, the deterioration of the rails had been greater during the last three years than the first three years of that time. But he considered that the present heavy engines should not bear all the charge of that deterioration, insame has the line was getting old, and the older it get the more rapidly would it deteriorate.—Several new members were declared to have been elected. In consequence of the advanced hour, the consideration of Mr. Ramsbotton's paper, on an improved locomotive boiler, was postponed to the next meeting. After a vote of thanks to the chairman, the proceedings terminated:—Birmingham Journal.

EXPLOSION IN STEAM-BOILERS PREVENTED BY ELECTRICITY.

· On Thursday last, Mr. ARTHUR DUNN delivered a lecture on this interesting • On Thursday last, Mr. Arthur Dunn delivered a lecture on this interesting subject, at the City of London Literary and Scientific Institution, Alderegate street. The lecturer commenced, after alluding to the general importance of the subject, by observing that all were aware of the frequent occurrence of these fatal steam-boiler explosions; the evils of them were not merely confined to the destruction of life and property, which were unavoidably its concomic and the property of the work of the fatal steam-boiler explosions; the evils of them were not merely confined to the destruction of life and property, which were unavoidably its concomic though not so fatal in its effects, was productive of great injury to the working classes, as but few cases occurred which were not followed by numbers of operatives being thrown out of employment, and, in some instances, weeks elapsed previous to the injury being so repaired that they could again resume their avocations. Mr. Dunn gave here an account of the several explosions which had recently occurred, particularly referring to the late one in Whitechapel. A few days after the explosion, with the permission of Mr. Keys, he had inspected the remains of the boiler; he had been told by several men on the establishment that not ten minutes previous they had passed the boiler, and to them it appeared to be sound, and no danger to be apprehended; he had minutely examined the boiler places, which were of the usual thickness, so that in that case there could be no ground to imagine that the boiler was unsound, or out of repair, being §ths of an inch in every place where the plates were torn. He did not profess to prevent accidents to unsound boilers; a defective boiler may cause an explosion, but it is the explosion of sound boilers that is most to be dreaded; boilars that are unsound give way at some faulty place, and, consequently, burst at their ordinary working pressure, and do not commit the fearful havoc that generally follows the explosion of sound boilers. In America st subject, at the City of London Literary and Scientific Institution, Aldersgate

merated in 6 cases); officers ditto, 57 (in 31 ditto); crew ditto, 108 (in 25 ditto)—while the general estimate of the total loss of life and property calculated from the average of the given cases was—Pecuniary loss, 236 cases, at \$43,362 each, equal to \$9,099,366. Loss of life at 11 each, 2563; wounded at 9 each, 2097—making a total of killed and wounded, 4650; this average, however, is not a fair one, as it is derived from but six cases, in one of which (the Pulaski) the very unusual number of 120 lives were lost.

Steam boiler explosions were caused either by over pressure, want of the proper quantity of water, and over temperature; the two first resolved themselves into the latter, which was the sole cause of the explosions. It was a singular fact, that belling water when placed on red-bot iron caused to boil. The celebrated chemist, Klaproth, had read a paper on this to the French Academy of Sciences about 1862; though this discovery had taken place some time previously. [Mr. Dunn here successfully illustrated the experiment by pouring boiling water from a vessel into a round iron saucer, made red-hot by means of a spirit lamp.] Mr. Grove had decomposed water by heat alone; but it required for that purpose an intense white heat. Freed from atmospheric air, it could be heated above its ordinary boiling point without generating steam; Donny had made several experiments which had proved this. If covered with a stratum of oil, this would occur. A practical proof of this he had experienced but a short time since. He had a small quantity of water in a common Florence flask; this was covered with a slight stratum of oil. A spirit lamp was placed underneath it; but before any steam was generated, or the lenst warning given that it was a totaling point, it exploided—the water being thrown to some considerable distance. Inventions have at various times been brought before the public—such as whistles, and various indicators attached to pressure gauge also self-acting valves. All are dependent upon steam pressure, an

had first thought of this invention some years since when in America. He was engaged in experiments to dissolve silica in close boilers under the action of caustic soda lye; this caused such an incrustation on the valve, that it was firmly comented into its seat, and, consequently, rendered useless. To obvitate this difficulty he had recourse to the use of a common thermometer, plunged into a mercury chamber; this led him to the idea of constructing a thermometer which should indicate any given temperature by audible signals.

Mr. Dunn here exhibited a handsome model of a boiler with the tabes; to these were attached copper wires, which communicated with bells placed at different parts of the lecture room. On the rising of the mercury by an increased temperature, the electric circuit was completed and signals were immediately given, proving that the boiler was getting beyond its proper working temperature. Diagrams of different sections of the boiler were likewise shown, and fully explained. If this invention was generally in use explosions could invariably be avoided, as the moment there was too high a temperature the boiler would signalise, and it would then be the place of the engineer to discover where the fault lay. He could not believe that any man would be so fool-hardy as to neglect a boiler, after it had plainly told him there was something the matter with it.

The principal points in the invention were its unerring action, trifling cost, and its dependence entirely upon temperature. The signals could be made at any number of places at once; a bell could be fixed in the engine room and the office; it was applicable to all boilers; the captain in his cabin, or the manufacturer in his counting-house, could reat satisfied his boiler was working safely. From the simplicity of the invention it is not liable to get out of order; signals such as pistols, detonating caps, &c., may be used; but as damp might affect these he had preferred the simple action of the bell. It could be applied to the steam of explosi

opportunity to see his boiler in action, when we shall give a more detailed description of its merits.

Telegraphic Expedition in America.—We understand that, on Saturday, the 7th April last, the whole of Messrs. Baring's trade circular, containing 1300 words, was written and conveyed from Boston to New York in 45 min. The Baltimore Telegraph Company, on the 18th April, declared a dividend of 4 per cent out of the proceeds of the previous three months' working

The Electric Telegraph Company, on the 18th April, declared a dividend of 4 per cent out of the proceeds of the previous three months' working

The Electric Telegraph.—We called attention in our Journal of the 28th April, to the outrageously extravagant terms which the Telegraph Company impose on the public, and the necessary consequence resulting from exorbitant charges, either by individual tradesmen or public companies—the loss of business by the former, and the indignation and neglect of the public in the latter, to whatever useful purposes the company may have been established. We have since received considerable information on the charges and working the American telegraphs; and from the smallness of the former, and the general civility and accommodation afforded in the latter, all the American lines of telegraph have already paid dividends exceeding those of other enterprises or of ordinary stock. The charges for messages of ten words are as follow:

—New York to Boston, 50 c.; New York to Philadelphia, 25 c.; Baltimore to Washington, 10 c.; Washington to New York and Baltimore to Cincinnati, 90 c.; Baltimore to St. Louis, 185 c.; Baltimore to Philadelphia, 25 c.; Philadelphia to Washington, 10 c.; Washington to New York to Beston, may be taken as an average, the distance is 200 miles, and the charge in English money is 2s. No wonder that the telegraph should have made such rapid strides, or that it should be still rapidly extending in all parts of the Union. We have before us a list of 27 distinct systems of telegraphs—the longest of which is fro

in Canada. Another line will extend from Portland, in Mayne, through eleven towns to the head of the Bay of Fundy, and to Halfax, in Nova Scotia; and other lines are in operation from Columbia to New Orleans, from Baltimore to New Orleans, and from Troy to the city of New York.

Mining in Norith Walks.—We are now very commonly receiving actual altestations of the abundance of mineral richas contained in the high slate districts of the principality. Gold, sitver, lead, copper, from, manganese, plumbago, slate, &c., are there being wrought with the most signal advantages. The natural facilities both for the discovery and working of the mineral lodes are very great, chiefly owing to the drainage afforded by the broken and precipitous character of the mountain ranges, and the well-known fact, that most of the lead veins, &c., carry ore up to the very surface of the earth, particularly in Cardiganshire, and other of the more central districts—thus forming a striking contrast to the generality of the mineral veins of Devon and Cornwall. Very recently, on a grant, extending under 1500 across of land, situated about eight miles east of Dolgelly, Meriouethshire, the property of Thomas Hartley, Eag., of Llwyn, a remarkably fine strong lode of silver-lead ore has been discovered, and which presents every appearance of equalling, if not surpassing, in yield and value some of the best veins of ore which, during the last few years, have been developed by successful enterprise in that previously much neglected neighbourhood.

Ceato Du Slatz Company.—We are glad to hear that the directors of this company are at last bestirring themselves, they having engaged Mesras. Brunton and Smith to conduct their engineering proceedings, under whose able management the resources of the quarry will, doubless, be fully developed. It is proposed, we understand, to connect the quarry labour.

The Miseral District or St. Australl.—The sett and materials of Rocks Tin Mine have recently been purchaseded by a highly respectable and opulant company

THE MINES OF IRELAND.*

During the heavy labours of preparing for the press a work that I thought of much national importance, and which is now ready for publication, being or mach national importance, and which is now ready for publication, being entitled The Progress and Policy of the English Pale in Ireland, fully Illustrated in the General History of the County Kildare, and Verified by Annals and Records, with Dates and Authorities, my attention was invited to the mines of Ireland. It is asserted, that no country in Europe, except Saxony, abounds more in metallic productions; in the belief of which our celebrated chemist, Richard Kirwan, laboured for several years to obtain the conchemist, tichard Kirwan, laboured for several years to obtain the concurrence of Government for establishing a board of mineralogy, to investigate these alleged mineral treasures, and to direct operations and workings thereof with certainty and economy. Out of the 32 counties of Ireland, 19 are reported to contain iron, 17 copper, 18 lead, and 16 coal; but, without yielding to any of the speculative enthusiasm by which Irish hopes are too often misdirected, I shall beg leave to submit some facts upon the subject, without note or comment. When I had gathered in all the annals that of certainty related to the county Kildare, I was anxious to embellish them yet more by other notices, which, though not identified with it by precise denominations, might yet, without any overstrained The contract of the contract o

Shannon.

Of the silver and lead mines, besides the tradition of the Four Masters, relating to Argiodross, it is to be noted that there is in the Vice-Treasurer's office, "An account of lead and silver made in the royal mines in the county Tipperary (of which was also preserved a description with maps), out of which the king is to have the sixth part of the lead, and the tenth of the silver, for the year to Christmas, 1638;" and another similar account for 1639, in which latter year Lord Strafford transmitted to King Charles an inget of silver hence, which weighed 300 ounces, writing at the

same time to the Lord Treasurer, that "the king's duty forth of the royal mines here will be 500L per amms." In simile was announced, in 1712, as "now brought to good perfection," and is to this day usefully and productively worked, giving the name of Silver Mines to the locality. The "Examinations of John Bealing, locksmith, touching a silver mine in Ireland," taken in 1607 and preserved in the British Museum, probably relate to this of Tipperary. Native silver has also been found, say Silr Robert Kane, in Wicklow, near the copper mines. Wakefield mentions a silver mine as once worked beside Williamstown, in the county Kildare, which seems identical with that reported in the Dublin Chronical of 1787, as then at work near the Chair of Kildare. Indications of silver are said to have been also traced in the county Wexford. "There are lead and silver mines in the county Autrim," says Boate, "so very rich that every thirty pounds of lead yieldeth a pound of pure silver;" he also mentions a lead mine in Coney Island, off Sligo. In Faulkner's Dublin Journal, of 1784, "lead and silver mines of fair promise" were stated to exist on the estate of Henry Bond, at Derrynoose, county Armagh; Wakefield notes indications of fead at Keady, in the same county, at Dundrum and Clonlegg, in the county Dworn at Ardmore, near Waterford; and near Enniscorthy, in the county Wexford. Lead ore has been found in the county Galway, near Lough Corrib, near Oughterard, on the shore of the Bay of Galway, and in that now promisingly productive expanse, the Connemara Mountains; as also at Grange-lill, in the parish of Feighcullen, county Kildare, a Copit, and the county Wikklow, at Glemnolaur and Glendalough; and in the county Wikklow, at Glemnolaur and Glendalough; and in the county Wikklow, and Glemnolaur and Glendalough; and in the county Wikklow, and Glemnolaur and Glendalough, and near Killiney Bay; the last was said to contain much silver.

Of copper mines, those at Mueruss and Killarney have been spoken of, and other veins are said to b

make during the last week "as to what coal, or other mineral productions, existed on the estate of Mr. Phillips, at Clonmore (above alluded to), in the barony of Costello, county Mayo; and to report on the nature and probable extent of such mines, and the facilities for working the same." Being accompanied by the inheritor and others to the place, where a pit had been sunk a few feet below the surface, he says—"I am of opinion that there is a most extensive and valuable coal formation existing under a very great portion of this estate. My examination has also convinced me that there exists under the said lands, to a large extent, all the minerals and materials necessary for the making and manufacturing of iron. The coal is of very good quality, of the anthracite species. I have dug it out of the ground with my own hands, and deposited samples of it in Dablin (as particularly described). There is also limestone on the spot in abundance; and, from the great quantity of oxide of iron existing and mixing with every rivulet of the locality, it is evident that ironstone, simi-

HITTE.

TOTAL PLANTS WITH STATE OF THE PROPERTY OF THE

lar in quality and produce to the ironstone of the anthracite coal districts of South Wales, will be discovered, the iron of which is so highly valued for its toughness and malleability. All these materials for making iron are lying convenient to each other, and, consequently, will not require any expensive transit, while the wages of labour are much lower here. The smelting of iron with anthracite coal (he adds), though formerly unsuccessfully attempted, is now brought to high perfection; and it is very possible that, by boring or trenching for the coal, the iron will be discovered, for it generally lies in the shale between the seams of coal. Coal is the mainspring of all industrial pursuits; and in this district, where the soil is naturally poor, and, except by strength of manure, can produce but little for the sustenance of man, the raising coal, even for the purpose of burning lime, in that and the adjoining counties, will be hailed as a blessing, the dispensing of which must be remunerative. The slack, or small of the coal, would answer for the burning of lime, and the large, or handpicked coal should be reserved for the smelting of iron. In a province where poverty has so long existed, and still exists, surely when we discover such resources for amelioration, the promptest means should be adopted to develope and make them available."

It should not be omitted, that there is, adjoining and around the site of these alleged mines, a tract of nearly 3000 acres of easily reclaimable waste, sloping through limestone to a sandy-bedded river, and with every material at hand for abundantly obtaining from it that relief which our now impoverished population so greatly need.

The Compendium of British Mining.

ORIGINALLY COMPILED AND PUBLISHED IN 1843.

REVISED, CORRECTED, AND ENLARGED FOR THE "MINING JOURNAL," BY J. Y. WATSON, ESQ., F.G.S.

CAMBORNE DISTRICT.

CONDURROW TIN AND COPPER MINE is in the parish of Camborne the sett being 600 fms, in length, and 156 fms, in width, and bounded on the west by Tryphena, and on the east by South Dolcoath. The country is granite, and the lodes (four in number) run nearly east and west, and parallel to those of Dolcoath and Stray Park Mines. The mine is held on lease for 21 years (17 unexpired), from E. W. W. Pendarves, Esq., M.P., at 1-20th dues. Conducted on the Cost-book Principle. Purser, Mr. Nicholas Vivian, Camborne; agents, Captains Charles Davey and Joseph Virian; persons employed, 160. Operations were commenced in 1844, and the outlay in calls has been 5632L, or 22L per share; present market valae, 95l. The returns have been from copper ore, 15,093L 19s. 7d.; tin ore, 3480l. 17s. 6d.—total returns, 18,574l. 17s. 1d. The machinery consists of a 35-inch cylinder pumping engine, capable of draining the mine to a great depth, and one winding engine. There are five working shafts, three of which are in course of sinking; the engine-shaft, which is the deepest, is 80 fms. below the adit of 50 fms., or 130 fms. from surface, and at the bottom there is a good course of tin, 7 feet wide. During the past few years a large outlay has been made in exploratory works, in opening the mine in an efficient and miner-like way, and considerable quantities of ore have been laid open. The present returns, both in tin and copper, yield a considerable monthly profit, and the appearances of the mine warrant the expectation of handsome dividends to the shareholders. About a quarter of a mile from Condurrow, Wheal Granville, a promising new speculation, has just commenced working. at 1-20th dues. Conducted on the Cost-book Principle. Purser, Mr.

Mining Correspondence.

BRITISH MINES.

BARRISTOWN.—The mining agent (May 4) reports—The lode in the wines sinking indee the Li for least is not allowether so wall for one as lest reported; in the field in the case we have a lode about 1 ft. wide, with good stones of result per fin. In the salti end east we have a lode about 1 ft. wide, with good stones of result per fin. In the back of this level the pitches look much the same as last reported. The stopes in the bottom of the salti are a little improved, producing at present about? were, of lead per fin. We were disappointed in getting a vessel down from Waterford to take the lead, but the Jane is now on her way here from Wales to take it, and I expect her in tomorrow.—Since writing the above, the Jane has arrived here for the ore.

HEFFERDED LINITED.—The manager (May 5) reports.—We vestered as held.

lead, but the Jane is now on her way here from Wales to take it, and I expect her in tomorrow.—Since writing the above, the Jane has arrived here for the ore.

BEDFORD UNITED.—The manager (May 5) reports—We yesterday held our usual monthly survey, and I have the pleasure to hand you a statement of the burgains and pitches that were set, with some remarks on the operations of the past month. The shaft is sunk 2 ms. 3 ft. below the bottom of the 103 fm. level; the ground continues to be favourable, and the men are making fair progress; the bottom cross-out has been driven 2 fms. 5 ft. 6 in. during the past month; the ground is rather harder than it was the present price is 80. per fm., the stent 3 fms., by sk men; we are drifty expecting to cut the south part of the 10de. The 90 fm. level east has been extended 2 fms. 9 ft. 5 in.; no lode has been taken down, and there is no alteration in the ground; the price for driving is the same as its tmonth—vis.: 97. 10s, per fm., and the stent 2 fms., by sk men. We are nearly under the shoot of ore we had in the 80 fathom level. The 70 fm. level has been axtended east 1 fm. 5 ft. 6 in.; no lode has been taken down; the ground is not quite so easy for driving; the present price is 87, per fathom, and the stent 2 fms., by four men. Burley's winze, in the 90 fm. level, has been same 3 fms. 3 ft.; the lode is rather lighter, and contains more grey and yellow ore; the last pile of 18 tons has been assayed, the produce is 28\ft. the value of the lode is, therefore, increased, and at the lowest estimate it is worth 901, per fm.; this winze is sinking at 2s. in 12, by six men. Crew's winze, in the 90 fathom level, has been sunk 3 fms. 2 ft.; the lode in this winze is sinking at 2s. in 12, by six men. Crew's winze, in the 90 fm. level to two men at 12s. 6d, to four men at 11s., to four men at 6s., to four men at 6s. In the back of the 80 fm. level one at 13s. 4d., two men. Our whim engine is working very well, and consuming about 6 coal per day.

BBYN-AR-IAN (Lead).—The mining age

coal per day.

BRYN-AR-HAN (LEAD).—The mining agent (May 7) reports—The lode
a the engine-shaft is large, yielding about 15 cwts, of ore per int. The stope in the back,
wer the deep adds level, is yielding 1 ton per frm. The stopes in the back and bottom of
be shallow add level are producing 1 ton per frm. We have now broken at surface from
5 to 30 term of lead ow, and hope shortly to commence dressing. The lode in the additional representation of the engine-shaft is large, and yielding good stones of ore.

level east from the engine-shaft is large, and yielding good stones of ore.

CALLINGTON.—The mining agent. (May 8) reports—The north engine-shaft is now about 8) fms. below the 112 fm. level—ground much as usual for sinking. In the 112 fm. level north the lode continues to look tolerably well; the back will work at a moderate tribute. In the south end, the lode is improved, and the ground more soft than we have lately had it; we expect at once to be opening good tribute ground. In the 100 fm. level south, the lode still continues small. In the north end, we have path the men to drive through the cross-course. In the 90 fm. level south, we are opening tribute ground. Kelly Bray lode, in the 100 fm. level west, its small and poor. In the 90 fm. level west, the lode is producing copper ores. In the 90 fm. level west, the lode is producing copper ores. In the 70 cast, we are taking down the south part of the lode, which is internized with copper ores. At the 60 cast, we have good stones of copper ores; the ground is a little more casy. At the south mine, in the 125 fm. level, both north and south, we are opening tribute ground. The same remark may be made for the 112 fathom level, north and south, we have a small bouth. In the 100 fm. levels south, the lode is producing aliver-lead ores.

CARTHEEW CONSOLS.—The mining agent (May 4) reports.—At the upper

the 70 and 40 fm. levels south, the lode is producing aliver-lead ores.

CARTHEW CONSOLS.—The mining agent (May 4) reports—At the upper
mine, our sumpmen have this week been engaged in clearing and accuring the 38 fm
level north, in the back of which it gives me a great deal of pleasure in being able to
state we find a very good loke in copper; and in clearing the 28 fm. level north of it
slide, we have very flattering appearances in very large stones of lead coming down from
the back; but the non-ventilarious of this level causes us to suspend further operations
here until there is a winze sunk from the 18 fm. level to it, which has this day been commenced. In the 18 fm. level, north of the slide from the tribute pitch, a rich pile of
work has been knoken te-day. In consequence of sinking the winzer in the bottom of this
level, we shall, for the present, be obliged to suspend further operations in clearing. At
the lower mine F find no particular alteration up to this time.

CWM ERFIN.—The mining accent (May 5) respects.

CVM ERFIN.—The mining agent (May 5) reports—Our 20 fm. level east is yielding 1 ton of ore per fm.; the stope from the end,5 fm. west, is worth 151. per fm.; the stope, 5 fms. west of ditto, is worth 52 per fm.; the stope, east and west of the rise, in the 20 fm. level west, will yield 5 no of ore per fm.; we have not driven more than 3ft. in our 20 fm. level, west of the whim-shaft, which at present is paor; but, from the ground seem in the bottom of the 10 fm. level, we may expect ore in 2 or 3 fms. driving. We are dressing from 4 to 5 tons of ore weekly, our machinery working well, and our

DEVON AND COURTENAY.—The mining agent (May 8) raportsang west, in the 48, the fode is 18 in. wide, composed of white iron, soft spar, and the some good stones of one; the ground is also more favourable for driving. In driving east, on the south lode, in the 50 five lode is 2½ ft. wide, I ft. of which such part; it is jeiding some good ove; the other part of the lode is composed of and spar; the lode in the rise in the back of this level continues to gradue

short 14 ton of ore per fin.

BAST CROWNDALE.—The mining agent (May 5) reports—Diamond's shaft is such to the 28 fm. level, and the fork below nearly completed; next week the man will be engaged casing and dividing the shaft. The 17 fm. level, east from Diamond's shart, contines suproductive; the fode is composed of clvan, peach, spar, mundic, and killias. The salit level west, on the course of Thomas's lode, is looking kindlier than it has for some time past; the lode is composed of killias, peach, mundic, gossen, and a small quantity of tin. Tippett's stope, in the back, continues to look well, composed of peach, prian, spar, mundic, killias, and tin, worth 401 per fm. Paull's stope, to the east, does not look quite so good, there being a much larger quantity of mundic in the lode than when last reported upon; it is seen possed of peach, killias, mundic, spar, prian, and this, and at present produces about 301, worth of tin per fm. We sampled, on Tuesday last, about 82 tons of tin.

HOLMBUSH.—The mining agent (May 8) reports—The lode in the 120 fm. level south is 4 ft. wide, composed of quarte and lead, saving work; the winse in the bottom of the 120, west of the great cross-course, being 9 fms. deep, we have suspended, and shall raise the remainder from the 132 fm. level, when the water is out, to make the communication, and have set the westers end of the wirse on tribute at 8s. in 11; the ground in the 120 fm. level south, east of Hitchina's shaft, is rather hard; we have intersected two small bramches of rich copper ore this week, dipping towards the main part, which is still further ahead. The lode in the 110 fm, level south is a ft, wide, producing 6 cwts, of lead per fm. We have at last intersected the Flap-jack lode, cast of the great cross-course, and find it to be 20 fm. wide, composed of copper ore, mundic, spar, and prian, in the midst of a beautiful white killas stratum; it will produce 2 tons of ore per fm., and apparently it is likely to improve as we get east from the cross-course. KIRKCUDBRIGHTSHIRE.—The mining agent (May 5) reports—The lode in the 50 end cast is about 18 in. wide; the black rock still continues on the north side, and the lode is unproductive. We have gone through a small bunch of ore in the 50 end west this week, which has again left us. We have still a large fine lode in the 50 end west this week, which has again left us. We have still a large fine lode in the 50 end west this week, which has again left us. We have still a large fine lode in the 50 end west this week, which has again left us. We have still a large fine lode in the 50 end west this week, which has again left us. We have still a large fine lode in the 50 end west this week, which has again left us. We have still a large fine lode in the 50 end west this week, which has again left us. We have still a large fine lode in the 50 end west this week, which has again left us. We have still a large fine lode in the 50 end west this week, which has again left us. HOLMBUSH.—The mining agent (May 8) reports—The lode in the 120 fm.

of lead on Monday next, per the Caledonia.

LAMHEROODE WHEAL MARIA.—The mining agent (May 9) reports—
The lode in the engine-shaft, which is large, and gives out a great quantity of water, has
considerably checked our sinking; with its present underlay and size, it will continue in
the shaft 3 fins, or more, and we shall, therefore, have to sink that depth in order to get
through it, so as to form a more correct opinion of its character. As soon as this is accomplished, I will write you more fully as to its character; as fair as we have seen it, it
is composed of capel, quarts, mundie, and copper throughout—in appearance a strong
and promising lode. At Davey's shaft, we are sinking at the rate of about 3 fms. per
month—the ground is unchanged.

month—the ground is unchanged.

MENDIP HILLS.—The mining agent (May 7) reports—In the slag department we have a pile of good alags prepared for the furnaces, which I intend smelting about the middle of the week. In Charterbonse Valley no material alteration has taken place in the appearance of the slagsingf since my last; the beds through which we are now opening continue to look well, being about 47 ft. thick. In Ubley and Blackmoor slag ground our present principal operations are in making the necessary carriage roads, waster-course for draining Blackmoor, and removing and levelling the ground for the new dressing-floors. The masons have completed the walls of the new workshops, and the carpenters are engaged about the woodwork for the same.

saler ground or present principal operations as a minimal in the course of casing floors. The masons have completed the walls of the new workshops, and the carpenters are engaged about the woodwork for the same.

OLD WHEAL PROSPER (Tr. And Coppers, near St. Austell).—The following reports have been received from different mining agents;—April 23.—"In examining this mine, I find the south lode is worked from the add level to the surface for sconsiderable distance, which must have been worked by the old men, centuries since, for tin. In the attle of the old men's workings there are fine stones of grey copper over to be found. I should think that this lode will make copper in depth, as it is a very strong-lode; and it will form a junction, about 50 fms. east, with a strong copper gossan, which has been worked on the backs for tin. Between this lode and the north toke, I find a large masterly lode, about 34 ft. wide, which is nearly all worked away above the old men's bottoms, except a few arches, which are good work for tim. This isole will form a junction with many counter lodes in the course of the sett. The north or main lode is nearly all taken away above the adit for upwards of 200 fms.; the attle in the old workings is good stamping work for tin. From what I can gather, the old men must have had considerable quantities of this; likewise, there are considerable workings upon this lode, below the adit which cannot be seen without the aid of machinery. I should think this mine a fair investment for capital, from the number of lodes and branches, and the extent of the old workings; and have no doubt but that it will make a good mine, it prosecuted."—April 24.—"I have examined the seet and underground workings of Wheal Prosper Mine; there are two lodes, from the number of lodes and branches, and the extent of the old workings; and have no doubt but that it will make a good mine, it prosecuted."—April 24.—"I have to lodes, from the number of lodes and branches, and the contribute of which work done, the old workin

stratum. It is well known to be a good tin district. I am further of opinion, that the Whiesal Proser Mine will ultimately make one of the most fourthing it mines in this county."

RHOSWIDDOL AND BACHFERDDON.—The mining agent (May 4) reports—The Smithy level is driven \$\frac{1}{2}\$ if: further, east, the men could not cut mony, because of the other of the lode. There is no change into more genial ground, the men having, this week, cut more ground than during the past month. The lode is also considerably more erey; it is \$ 6, wide, all saving work, worth \$\frac{1}{2}\$ to me firm, and has turned out as expected at the time of my lasa report. We believe it will considerably improve again in a few fathoms. The stope No. 2 and 3 have improved, one worth \$\frac{1}{2}\$ ton to a fin. The stope No. 2 and 3 have improved, one worth \$\frac{1}{2}\$ ton to a fin. The stope No. 2 and 3 have improved, one worth \$\frac{1}{2}\$ ton to a fin. The stope No. 2 and 3 have improved, one worth \$\frac{1}{2}\$ ton to a fin. The stope No. 2 and 3 have improved, one worth \$\frac{1}{2}\$ ton to a fin. The stope No. 2, the stope is driven 2 fins. through good overy ground; the men after varies stoped this length to the 10 fin. level, to make room, for a footway; this stope produced 1 ton to the fin. The 10 fin. level is driven 3 fins. east, and has improved a little; the end is worth \$\frac{1}{2}\$ ton to the fin. The stope No. 5, in the salt level, is in a good course of ore, worth more than a ten to the fin. We continue to bring an enormous quantity of a tile to the new floors, which is immediately passed through, as fast as brought out. In the dressing department we have, at present, not a full complement of hands; more are expected next week: we have a sufficient number in the upper floors to take out of the rough, which is by far the greatest labour. From the accompanying estimate of the quantity of ore each bargain has produced, you will see the produce for Aprilis about 29 tons. As there are greater facilities for working in May, a great

sour, and, consequency, more ore, which we will gradually increase monthly for some months. We intend shipping a cargo of ore at the ead of this month.

SOUTH WHEAL JOSIAH.—The mining agent (May 7) reports—Since I wrote you last, we have a great improvement in the mine. The lode for some time was a little disordered, but has now become regular, with two well defined wails, with a fine flookan on the north; it is now 4 ft. wide, composed of soft spar, gossan, prian, and spotted with copper and some good stones of ore, principally of the nature of the adjoining mine (the Great Maria)—black and yellow ore, with white prian and soft spar. We have driven, the last month, 8 ms. 1 ft. The sati is now in the hill about 15 fms.—driving at 35s. per fm. In this situation we cannot fall to have a good mine; and it is well to mention here the situation of this very promising spot, being joining the best mine in the world, and having several of the same lodes running through it—this new mine being situate adjoining to the west of the Great Devon Consols, and occupying the whole of the ground between those rich mines and the Heigmaton Consols, and bounded on the south by the Gunnis Lake Old Mine, which has given its tens of thousands profit to the adventurers; so that South Wheal Jostah is surrounded by the richest and most promising mines in the counties of Cornwall and Devon.

SOUTH WHEAL TRELAWNY.—The mining agent (May 7) reports.

SOUTH WHEAL TRELAWNY.—The mining agent (May 7) reports— he engine-shaft is in course of sinking with nine men; ground still favourable; a little crease of water. The engine continues to work, well; other things are also in a regu-recourse of working.

increase of water. The engine comments to work the control of waters are control of working.

TAMAR SILVER-LEAD.—The mining agent (May 7) reports—In the 190 fm. level the shaftmen are engined cutting a plat; in the end driving south, in this level, the lode is 1f. wide—good stamps work. In the 175 end the lode is 6 in. wide, producing work of a good quality. In the 160 end the lode is 2f ft. wide, and opening good tribute ground. In the 145 end there has been no lode taken down since last reported on; but the discovered wall is presenting a favourable appearance; in the winze in the bottom of this level the lode is 2f. ft. wide, yielding some good work. We hope to be in a position to drive the 135 end, when we expect to open good profitable ground to the south of the alide course. At North Tamar, in the 80 fm. level, the lode is small, but occasionally producing good stones of ore. In the 70 fm. level, driving north, the lode is 3f fix wide, interspersed with, ore, asving-work, but of a coarse quality; in the south end, in this level, the lode is 2f feet wide—18 inches of which is good work. We sampled, on Saturday, the 5th inst., computed 91 tons of rich aliver-lead ores.

south end, in this level, the lode is 2½ feet wide—18 mehes of which is good work. We sampled, on Saturday, the 5th inst., computed 91 tons of rich aliver-lead ores.

TINCROFT.—The mining agent (May 7) reports—At Palmer's shaft, on East Pool lode, in the 90 fm. level west, this lode is 2 ft. wide, with atones of copper ore. In the 80 fm. level west the lode is worth 17. per fm. for copper. The lode in the 24 fm. level, driving west towards Stainsby's shaft, is worth 40, per fm. for copper. The north Tincroft, the lode in the 100 fm. level east is worth 157, per fm. for copper. At north Tincroft, the lode in 100 fm. level east is worth 157, per fm. for copper. The 100 fm. level east of Willoughby's shaft, is worth 49, per fm. for copper; in the 90 fm. level, east of will worth 127, per fm. for copper. In the 80 fm. level, east of Willoughby's shaft, the lode is worth 118, per fm. for tin. On High. Burrow lode, in the 152 fm. level, east of engine shaft, the lode is worth 148, per fm. for tin. In the 142 fm. level, cast of Martin's cast shaft, the lode is worth 141. per fm. for tin. The 132 fm. level, east of Martin's cast shaft, the lode is worth 148, per fm. for tin. The stopes in the back of this lovel, cast and west of the shaft, are worth 164, per fm. for tin. In the water of, in the same level, the lode is worth 127, per fm. for tin. In the wince shiking below the 120 fm. level, east of Martin's east shaft, the lode is worth 164, per fm. for tin. Chapple's lode, in the 100 fm. level, west of downright shaft, is worth 64, per fm. for tin. Chapple's lode, in the 100 fm. level, west of downright shaft, is worth 64, per fm. for tin. for tin of the per fm. for tin. Perel, on ton't shaft, shaft, is worth 64, per fm. for ton, for fin. for tin. The vines shiking below the 190 fm. level, on the 100 fm. level, on the 100 fm. lovel, west of downright shaft, is worth 64, per fm. for tin, for tin and copper.

TRELEIGH CONSOLS.—The mining agent (May 5) reports—Garden's

the 72 fm. level, on south lode, is worth st. per fm. for tin and copper.

TRELEIGH CONSOLS.—The mining agent (May 5) reports—Garden's shaft, below the 113, is sinking in the country south of the lode; in the 113, west of ditto, the lode is 4 ft. wide—not much ore. In the 99, west of ditto, the lode is 20 in. wide, producing it ton of ore per fm., and still looking kindly. In the 89, west of ditto, the lode is 22 in. wide, with stones of ore. In the 60, west of ditto, the lode is 2½ ft. wide, with stones of ore, and is looking more promising. Wheal Parent shaft, below the 29, is sinking in the country; in the 20, cast of ditto, the lode is 2½ ft. wide, composed of ore, mundle, and jack; the 20 cross-ent is diviving conth in the country. In the addicast, os the middle look, the lode is 99 in. wide, and will produce 1½ ton of ore per fm. We expect to sample, on Tuesday next, about 80 tons of ore.

WEST WHEAL JEWEL.—The mining agent (May 7) reports—In the winze in the bottom of the 57 fm. level, west of Williams's cross-course, on. Wh. Jewellode, lode 2 ft. wide, worth 14t, per fm.—sunk last month 2 fms. 2 ft. 6 in. In the 47 fm. level, west of Williams's cross-course, on the same lode, lode worth 9t. per fm.—drove last menta 2 fms. 1 in the 47 fm. level, west of Williams's cross-course, on the same lode, lode producing stones of ore—drove last month 1 fm. 4 ft. 6 in. In the 3 cross-course, aserth from Buckingham's lode, ground harder far driving than when we last set to drive

drove last month 4 fms. 3 ft. The cross-cut driving north in the adit level, under goning's shaft, sinking below the 12 fm. level—sunk last month 1 fm. 4 ft. The stop the bask of the 13 fm. level, wast of Prov's winze, on Tolearne the lode, lede worth por fm t. the stopes east of this winze, in the back of the 12 fm. level, wenth 10 ft. per fm. the stopes in the bottom of this level, eact of Tregoning's shaft, worth 15 ft. per fm. stopes east of Tregoning's winze, in the bottom of this level, worth 16 ft. per fm.

stopes in the bottom of this isvet, was a frequent shall, worth 16th per fine; the stopes cast of Tregoning's winze, in the bottom of this isvet, worth 16th per fine.

WHEAL ANDERTON.—The mining agent (May 10) reports—The lode in the 90 fm, level continues large, producing some good tin work; and very likely to produce large quantities of ore in its further development. The 80 west of shaft, is clear of the cross-course, and I am daily expecting to cut the lode on the west side, as the water is fast issuing through the ground. The lode in the 70 fm, level, being west of the 80 and 90, is 6 ft. wide, about 24 ft. good stamping work—stoping the back at 6s. in 11. We have not yet cut the lode to the cast of the side in the 80; but expect to do it shortly, as the end is now in clean killas ground. The various pitches are just as last reported on, tributers getting a fair remuseration in their respective tributer, ranging from 8s. to 8s. in 11. I slipped for Charlestown, yesterday, 7 tons of tin at 49t. 17s. 6d., 2 tons at 39t. and 13 ton at 49t; and hope next parcel will be more, with an advanced price.

WHEAL RENNY—The mining ground.

and 1½ ton at 49t.; and hope next perceasy, 7 tons of the at. 49t. 17s. bod., 3 tons at 59t. and 1½ ton at 49t.; and hope next perced will be more, with an advanced price.

WHEAL BENNY.—The mining agent (May 3) reports—Since last report we have dropped the lift which we berrowed from Lambertone, and have resumed driving west upon the course of the lode; it is increasing in size, and though not rich, gives kindiler indications than it has done before. I should, therefore, recommend continuing this end of the mass further; on the south lode we have intersected a cross branch, which has disordered the lode. Previous to this intersection the lode was 5 feet wide, compact and kindly, but it is now apilt into several branches, which will, however, I have no doubt, reunits within a short distance; I should, therefore, recommend the further prosecution of the works upon this lode, 30 or 40 fms. castward, as you are aware, from my former report, that some feeders will form a junction with it within that distance, and it is to be hoped will greatly improve its character. Our future monthly cost to carry on these operations upon the present scale will be about 40t to 42t.

WHEAL PENHALE.—The mining agent (May 4) reports—We have divided, cased, and put footway in the engine-shaft down to the 20 fm level, and commenced opening north and south on the lode, which we find quite as good as herotofore reported—worth for load 18t, per fm., but will cost only about 50 per fm. for driving the same, the lode in the 10 fm. level end north continues to look well, in the south end, in this level, I can notice no particular change; in the new pitch, which k have set in the back of the 10 fm. level, north of the engine-shaft, there is a very good lode, principally in copper. The other pitches are without much variation. Our engineer was here a few days since, and expressed himself highly pleased with the grinder, water-wised, and house, but thought the latter was not sufficiently day to admit of the grinder of the significant particular

consequently femering it uses ever area. Inav. Inarctore, pas or working ours until Monday next, when we shall so ther to work.

WHEAL TREHANE.—The mining agent (May 3) reports—We have cut through the lode in the 68 fm. level (about 10 ft. case of Kelly's shaft); it is 18 in. wide, composed of capel, can, and mundic, with good stones of lead. We have cut through several small branches in driving the cross-cut, which is split from the lode, by disordered ground, about this place, and is, no doubt, the cause also of the lode making a greater underlay from the 85 than any other part of the mine: the lode, however where now cut; and underlaying at the rate of 10 in. to the fm. westward; and as we get into more settled ground, I have no doubt but that it will be fmmd to have returned to its usual underlay and bearing. We shall now commence cutting platt, &c., and as soon as possible drive both north and south on the lode in this level, The 55 fm. lovel north is driven to the boundary, and we are now stoping the back near the end. The stopes in the back of this level are producing on an average about 5 cwts. of lead per fm.—ground rather hard. The lode in the stopes in the back of the 46 fm. level is producing 6 cwts. of lead per fm.—if the consecut at the 30 fm. level west, we are still in killas ground; and favourable for driving.

and favourable for driving.

WHEAL VINCENT.—The mining agent (May 9) reports—In sinking on the south lode, we are breaking excellent work; the lode is much improved in tile last ew days, and the country around of a beautiful soft nature. The men sinking in the bottom of the streams are down as far as they can go, and are now driving to cut the lode, and in doing so they are discovering some excellent stones of in broken off from the lode before them; the ground is very soft, and we expect in a few days to cut the lode. We have again commenced sinking the engine-shaft, the ground in which is favourable for sinking; There is also an improvement in the north lode, as might be expected, being getting under the shoot of tin gone down in the bottem of the shallow adit. We thought to have set out wheel at work this week; but in consequence of our shaft not being deep cough, we are obliged to sink a little before we drop our lift; however, it does not prevent our progress, as our shaft is in course of sluking.

FOREIGN MINES.

FOREIGN MINES.

IMPERIAL BRAZILIAN MINES.—Bananal, Feb. 23.—At this place our cross-cut westward, in the adit level, from Wray's and Goldamid's, and between Thomas's and Hollingworth's shafes, and at the 14 fm. level from Walker's, proceed regularly, but have disclosed nothing of censequence. We have two parties of men driving towards each other in the 7 fm. level, between Thomas's shaft and the cross-cut westward in the same level from Walker's, and as soon as this communication is made, we shall be able to drive northward on a vein which gave a few traces of gold, and shall proceed to stope away some ground between this level and the adit, on the northern side of Thomas's shaft, is which we hope to find a little gold. Our 14 fm. level, from Thomas's shaft, was so rapidly augmonting the water there, as to threaten to drown our machinery; we have, therefore, anapsuded it, and are stoping the back of the level south of the shaft, where we have obtained a little coarse work for the washing-house. We are pursuing a libre coarse on the day super, evalue, in the back of the level, with a sainlar result, by dint of great exertions, and in spite of a creat quantity of water, we have entail about 8 feet below the 7 fathom level, west of follingsworth's shaft, the vein is very poor in the deepest parts, but there is a small portion of it which will serve for the stampe, on the dide nearest the shaft, and this we are removing. A second rise above the adit, west of the same shaft, in now about 5 fms. in length, but nothing of the slightest consequence has been seen in it. The rain water which has percolated into the shallow adit, west of the same shaft, has softened the ground, and made further progress very troublesome; we have discontinued our trials for the present, but intend resuming them in the dry season, our right on the best veins we exist find at Santa lift laving been so very disconraging, we have removed. His people thence to Morrod as Alias, where we find some veins which give a few particles of gold, althoug

KAPUNDA MINES (South Australia).—The following are extracts of letters from Capt. Bagot, dated Adelaide. Dec. 30:—"The mine is now in capital working order. All the shafts are down to the 30 fm. level, and we are getting the ores at that depth opened, so that we will soon have a large extent of all the ledes in a state to be productive. Hitherto we have only raised ores of high produce, as none others would stand the expense of transmission to Swansea. When we can take an average of 14 or 15 per cent. produce for smelting here, our quantity would be tenfold what we could otherwise send to Europe. We calculate that we could easily supply a smelting-work with ores of that average at the rate of 500 to 700 tons per month, and that even at the low rate at which the Burra Burra have agreed with the Schneider Company, our balance to profit from these quantities would be from 12001. to 20001. monthly. Hitherto all has been only hit us, and fully 30,0001 has been smalt in bringing the mine unto its present efficient working state. Our power and machinery are amply sufficient to carry us down at least as far again as we have gone, and that will be through that part of the mine from which, to judge by what is usual in most mines, the best results may be anticipated. We begin next month to sink to the 40 fm. level, and expect in three months to have thopen for tributes. Schneider's poople are advancing rapidly with their smelting-works at the Burra Burra; they have also made an agreement with the Kammantoo Mines. A smelting-work, on rather a large scale, is nearly ready to go to work near the port, and two small ones in the country are working. A company has also been formed in Van Diemen's Land for smelting; there they have coal in abundance, which they say can be raised at 2s. 6d. per ton."

From a letter dated Jan. 6;—"We have just had the first tribute work of the 30 fm., lored assayed, and, to our astonishment, it is rather ever 80 per co

IRISH MINES-THE CORK MINING DISTRICT.

Sin,—In the article respecting the Cork Mining District, which appeared in your Journal of the 28th April, in describing Killeen Mine, the word "galena" was inserted instead of "gossan;" the lode being compaced of gossan, quartz, and large quantities of mandic, strongly impregnated with copper ore. The appearance of the lode has greatly improved since the article in question was written.—Anglo-Cenx: May 4.

[We hope to be favoured with further communications from our intelligent correspondent, whenever opportunity may offer.]

MINING IN IRELAND.

MINING IN IRELAND.

Sin,—Observing, from several articles in your Journal, that you feel interested in the success of mining speculation in Ireland, I think I ought to make you aware that the Irish Poor-law throws obstacles in the way that amount almost to a prohibition to undertakings of that description there. In Cornwall, the mines are assessed to the relief of the poor at the amount of royalty paid the preceding year; and the lords pay the raic, who are the persons who ought to pay it, as they are never subject to any risk, and must necessarily have a fund from which to pay it. In Ireland, the amount at which a mine to the assessed is fixed by the guardians of the union—men who know nothing of mining, and who never, perhaps, saw a mine in their lives, or have been within 80 miles of the mine to be assessed; and the poor-rate is to be paid by the adventurers on that assessment.

within 30 miles of the mine to be assessed; and the poor-rate is to be paid by the adventurers on that assessment.

I will state what occurred with respect to one of the most extensive mines in Ireland, which will fully explain the effect of the Irish Poor-law on Irish mines. In the year 1847, the mine was assessed at a value or profit of 8000\(lambda\). As year, and a rate of 3s in Il. was struck on that value, amounting to 1200\(lambda\). The adventurers appealed; they showed the accounts for the year 1846, from which it appeared that the mine was worked at a loss of nearly 4000\(lambda\). The persons who were to decide the appeal were convinced of the correctness of the accounts; and you would suppose that the mine would be discharged from all rate, as the adventurers were to pay it, instead of which they still insisted on a value of 8000\(lambda\). A year, and on that amount the adventurers continued to ite rated. The less in 1847 has been about the same; and, in the lax year, a there was still a loss. The lords have been, for each of the three years, receiving a royalty of near-4000\(lambda\). How can it be expected that adventurers will embark their capital in mining speculations in Ireland when they are subjected to see

heavy a tax, from which they are totally free in England? Lord John Russell's object appears to be to fix permanent assessments for the relief of the peor; but the absurdity of making permanent assessments of mines must be evideut to all who are acquainted with their nature. Instead of holding out the encouragement you propose for working mines in Ireland (and they would be the greatest source of employment of the population of the country), the Government sceme to be throwing obstacles in the way.

Tenly, May 7.

ANOTHER ANGLO-CELT.

SPEARNE CONSOLS MINING COMPANY.

Government seem to be throwing obstacles in the way.

Tenby, May 7.

SPEARNE CONSOLS MINING COMPANY.

Siz,—A statement of Spearne Consols account of the 30th of April having appeared in the Mining Journal of last week, wherein only a "balance of 3551 13s. 10s. was shown in favour of the mine." I beg to remark that, had the assail method of charging the merchants' bills been resorted to—viz: two months' bills for two months' tim—the balance in favour of the mine would have been upwards of 4351. The adventurers, therefore, should have received 31. per shares, and then upwards of 501. would have been placed to the credit of the mine. This matter you will more fully understand, when I inform you that our meeting was held for the months of January and February, yet all the sandles were charged up to the end of April; and we were charged with a sufficient quantity of easls for our consumption up to the end of June! I am an old miner, but this mode to me is new and novel; therefore the dividend of 11. per share is a mere farce, and most unjust.

I herewith append a report of our general prospects in this mine:—"In the 116 fm. level, east and west of the engine shaft, we are in good tin ground. In the 104 we re in a good course of tin for many fms in length; the ends are rich. In the 80 and in the 70 we are in good tin ground. Our 60 end is nearly in contact with Button White's lode—ground much improved for tin, and much softer. Our expectations are very sangulne as regards this part of the mine as soon as we meet the junction, as there is a fine course of tin in the bottom of the level above on the aforesaid lode. On this lode, in the 40 east, we have also a fine course of tin, which is in whole unexplored ground, no level having been extended above or below it; 14 men are employed here, who are paying the cost of the mine. In the 30 east, on the north lode, we have a good course of tin; and in order to make this available, we are in course of sinking the shaft under the 20, and expect to hole to the 30 by the end of

di-

TRANSFER OF MINING PROPERTY-ARE STAMPS REQUISITE?

TRANSFER OF MINING PROPERTY—ARE STAMPS REQUISITE?

Siz,—A question of considerable importance to the mining interest has been mooted, in consequence of the circulars lately issued by the Board of Stamps, in respect to the transfer of property in railways, and other joint-stock companies. It appears to me, as it does us those with whom I have conversed upon the subject, that the alarm, as it regards mines, is quite premature, though, perhaps, it would be as well to have the matter at once decided upon, and set at rest. It has been the custom, I may say for centrales, for shares in mines to be handed over from one party to another by a letter, or notice to the purser of the mine, to be entered on the cost-book of the partnerships formed for working mines on the Cost-book Principle but that which custom has sanctioned, and with which no Governments have attempted are exempted from its operations, and what is the Cost-book Principle but that which custom has sanctioned, and with which no Governments have attempted to interfere?

To my thinking, no notice whatever should have been taken of the circular; and I was surprised to hear that one purser, who boasts of more than the usual intelligence of his class, should have been the first to refuse one of these notices, which refusal, if taken as a precedent, would have the effect of stopping half the mines now at work, and doing incalculable injury to the county of Cornwall. The matter is of more importance in its various bearings upon the mining interest than the mere casual observer may suppose. No out-adventurer would hold shares in unpaying mines, or join in new undertakings, if the system of transfer was changed, and it was on this account, it is supposed, that successive Governments have allowed the system to go on, because a change would entail a great and lasting injury upon the Duchy of Cornwall, and on the mining interest in general, for which the receipt of a few paltry stamps by the Government would be but poor compensation. I trust, therefore, we shall hear

ON THE ECONOMY OF MINING IN CORNWALL.

Corabill, May 9.

On THE ECONOMY OF MINING IN CORNWALL.

In perusing the Mining Almanack, I was much struck with the proposition of James Sims, engineer, in regard to a subject which occupied your columns some time ago—viz.: the mode of setting the work in the mines of Devon and Cornwall; and while I agree with him in deprecating any system which would deprive the miner of a fair price for a fair day's work, I would even go further than he does in respect to the minimum of wages. But my object in writing this paper is to take an exception to the principle laid down by James Sims, to do the different work by "day—work" instead of "contracts," or, in other words, to make all the men "owners' account men." Now this system would, I believe, seriously affect the miners in a variety of ways, and tend to depreciate them, not only in their own estimation, but produce a degree of inertness and careless which would be prejudicial to their character as men and labourers. If there is mything in the idea that it is the hope of reward which sweetens labour, surely such stimulus is more to be found in a system of contract, than in the so much per day system—in fact, what is it that renders the miners of these counties such active and energetic characters, but the system of contracts. Now, in regard to profit and loss to the adventurers, I hold, even admitting the getting of "starts" now and then, that this very circumstance is advantageous to the adventurers. I would even go so far as to include a good take on tatwork as well as tribute; it cheers the men, and makes their toil in some degree pleasurable, compared to the sameness of working on day-work, and no chance of doing better; but I go further, and say it would be almost impossible to work the generality of mines by "day-work;" what a number of extra agents, or gangers, would be necessary; what a waste of materials would ensue; instead of 6 inches of powder in the blast, there would be almost impossible to work the generality of mines by "day-work;" what a number of ext

MAGNETIC AND GALVANIC CURRENTS.—Although the sciences of magnetism galvanism, and electricity have been effectually blended, and proved by various experiments to be the effect of one primary cause, the direction of the magnetic currents compared with galvanic currents is considered different, i.e., that the magnetic currents move dt right angles to those of galvanism. This idea has arisen from the effects of the spiral course, in which the external current that envelopes the connecting wire of a battery moves. On the upper side of the wire it moves towards the north-west, and on the under side towards the north-west, and on the under side towards the north-east; the amount of the variation depending on the intensity of the action, both div(rg) from; ind converge to the same poles.—Hopkins's Geology and Magnetism.

DEVONSHIRE GREAT CONSOLIDATED MINING COMPANY. The annual general meeting of adventurers was held at the offices of impany, Barge-yard Chambers, Bucklersbury, on Monday, the 7th inst.

WILLIAM ALEKANDER THOMAS, Esq., in the chair.

The annual general meeting of adventurers was held at the offices of the company, Barge-yard Chambers, Bucklersbury, on Monday, the 7th inst.

WILLIAM ALEXANDER HOURS, Esq., in the chair.

The usual preliminaries having been gone through, the directors' report, and also that of Mr. J. H. Hitchins, the managing agent, were read, and received with evident satisfaction. DIRECTORS' REPORT.

It is with much satisfaction. DIRECTORS' REPORT.

It is with much satisfaction the directors meet the shareholders of the Devoushire Great Consolidated Copper Mining Company, at the fifth annual meeting of the company, to submit for their approval a balance-sheet, exhibiting the successful result of operations for the past year, and the finances in a most dealrable position. It will have been perceived by a single glance of 7th for the wards of gone of the relation of the past year, and the finances in a most dealrable position. It will have been perceived by a single glance of 7th for the wards of guality having been the same within one-eighth per cent.; while the proceeds realised for the same have diminished by about 30.44,—an evidence alike both of the continued by reductives so of the mines, and of the depreciation of the value of copper ore, which continued for several months—thus causing, comparatively with the higher price to take the first of the depreciation of the finances, in conjunction with a fair and legitimate division of profits, the price of the comparative of the mines. The mines cost sheets, far from having increased with the greater production of one, will be found, on a more minute scrutiny of the balance-sheet, to have been less by upwards of 10,5001; while the division of profits has been just double that of last year. Great praise is due to those to whom this department is entirasted, and to Mr. Romas Morris, our resident director, who has taken good care to avail himself of opportunities of selecting the materials both of the best quality, and in the best possible markets. U-der such favourable circumst

The following abstract statement of accounts for the year ending on the 1st of March was also presented, a copy of which having been issued to the respective shareholders three weeks previously, n accordance with the provisions laid down in the Joint-Stock Companies' Act:—

Resolutions were unanimously passed, tendering the thanks of the company to the directors, managing agent, and other officers, for their excellent and judicious management during the year.

judicious management during the year.

The manager's report, being of the usual voluminous and elaborate character, and accompanied with extensive tabular matter, is, we learn, in course of being published in the form of a pamphlet, by the direction of the board, for the general information of the shareholders. From the pre-eminent position which these mines take—their unrivalled stand and general importance in connection with the great mining interest of the British empire—we should be omitting a bounden duty were we not to afford more than a passing notice of this meeting; but, having been promised, through the courtesy of the directors, a copy of the document, we therefore postpone our remarks until we obtain it, when we shall furnish an analysis of the operations carried on in this vast deposit of mineral wealth.

BLASTING BY GALVANISM.—A very satisfactory application of this powerful agent has been made at the Rathmore tunnel, near Cork. Under the able superintendence of Messrs. M'Henry and Glassford, upwards of 30 tons of rock were completely detached from the face, many blocks of half a ton weight being thrown 10 to 12 yards distance.

HEIGNSTON DOWN CONSOLS, MINING COMPANY."

HEIGNSTON DOWN CONSOLS MINING COMPANY.;

The two-mostbly general meeting of adventurers was held at the offices, Threadneedie-street, on Tuesday, the 8th inst.

JAMES ASSIWELL, Esq., in the chair.

The minutes of the last general meeting having been read and confirmed, the cost-book and bankers' pass book, showing balance of 20L 15s. 3d. in favour of mine, as also an estimate of assets and liabilities, the former amounting to 2805. 0s. 3d., and the latter amounting to 1194. 9s. 4d., were laid before the meeting.—The March cost-sheet of the mine, with the merchants' bills were exhibited and passed.—Mr. J. H. Hitchins's report of the 7th inst. was then read, and a call of 5s. per shire made.—It was resolved, that the secretary address a letter to Mr. S. Kernick, Charlestown, in reply to his letters to Mr. J. H. Hitchins, respecting the error he states to have committed in making the tender of 47L 17s. 6d. per ton, for 7 tons 6 verts, of fin, offaring to release him from the same, provided he will take the tin at the next highest tender of 3th 15s. per ton.—In fature all tenders for tim or other ores are to be forwarded to the secretary—a sample having previously been sent to the different ameling-houses by the superintendent at the mine.—The following is an abridgment of the report which was presented to the meeting:—

Tanistock, May 7.—But little will be required to be said in reference to the progress and prospects of this sencers, a comparatively little has been accomplished towards its development since the last meeting.—Balley's engine-shaft is now in effective course of sink-velopment since the last meeting.—Balley's engine-shaft is now in effective course of sink-velopment since the last meeting.—Balley's engine-shaft is now in effective course of sink-velopment since the last meeting.—Balley's engine-shaft is now in effective course of sink-velopment since the processory works preparatory thereto; a baryan has been taken to complete the next 10 fm. lift for the sum of 140L, the takers engaging to pay the

KINGSETT AND BEDFORD MINING COMPANY.

The two-monthly meeting of shareholders was held at the Globe Inn, Exeter on Monday, the 7th inst.—Capt. W. Fulford, R.A., in the chair.—The purser's accounts, showing balance of 1771. 16s. 3d. in favour of the company, having been passed, a call of 5s. per share was made.—The Chairman stated, that arrangements were making for the payment of the 400L, which the finance committee had agreed should be paid to the lessees.

The following report, from Capt. John Spargo, was read to the meeting:—

mittee had agreed should be paid to the lessees.

The following report, from Capt. John Spargo, was read to the meeting:

May 5.—This being our regular setting day, and within a day or two of the meeting, we thought proper to cut into the lodes so far as we have risen on the Bedford rise, as well as take down the lode as far as able in the end driving north. I am most happy to inform you that the lode in the Bedford rise is much improved since I, with Capt. James, last saw it; in fact, it is now a good lode for lead; therefore, I need not tell you that we are opening good stopes, or tribute ground, here. The eastern lode, going north, is just as when we last awn it, producing some excellent stones of lead; the spar is getting more soft, and there is every likelihood of a great improvement. We intend to drive a few feet further, and beg again to remind you of the propriety of rising here, as it will be beneficial for our future questions. The state of the old workings; secondly, it will be proving the ground as we rise up; thriftly, it will be saving a great deal of cost in getting away deads, &c.; fourthly, it will ultimately serve for a shaft to throw in rods to sink under the adit, as well as enable us to stope the bottoms, &c.; in fact, I consider it to be just the position for one of our main shafts under the adit, both as regards dressing-floors, and the right part for wheels, &c., as the matter is most convenient here. The copper lode loaks well; it is increased in its bearing about 10° further than when we commenced driving; it is now about 50° north of east, composed of spar, mundic, and spots of copper. It carries a small fissure about 1 in. whe near the foot wall. It is large, but the most favourable part is about 24 ft. wide, with a great deal of wall. It is large, but the most favourable part is about 24 ft. wide, with a great deal of water proceeding from the above fissure or crevice. We shall see more of this as we drive on. As regards the new lead lode we need to sink a few feet deeper on it, as

NORTH WHEAL FRIENDSHIP MINING COMPANY.

NORTH WHEAL FRIENDSHIP MINING COMPANY.

A general meeting of shareholders was held at the office, Tavistock, on Friday, the 27th April.—John Rundle, Esq., in the chair.—The accounts for Jam., Feb., and March were examined and passed, showing—Balance from last account, 234f. 14s. 11d.; January cost, 101f. 6s. 1d.; Feb., 100f. 14s. 7d.; March, 207f. 3s. 11d.—643f. 19s. 1d.—By 3d call of 10s., 512f.; leaving balance due from adventurers, 131f. 19s. 6d.—A call of 10s. per share was made. The following report was read to the meeting:

Since the last meeting the engine-wheel has been erected, and was completed about the latter end of February last, and we have since sunk the engine-shaft between 8 and 9 fms. through a very large and kindly lode, composed of gossan, mundle, &c., and which holds down to the present bottom—now about 18 fms. from the surface. We have been, and still are, shoding the Holditch estate, but have not found anything as yet worthy of much notice. The shoding to north of the Gibbet has not yet been resumed, in consequence of the continuance of the wet weather, but we hope to do so as soon as possible. At Wheal Betsy we continued to work some of the old pitches to the end of March; but since then we have stopped them, in consequence of the tevels being flied with work, There is now fully 150l. worth of lead oros: ready to be drawn to surface. We hepe to have a whim creaced in the occurs of a week, when these ores will be handed up. We have cleared out some of the old sinks in the bottom of the 36 fm. level, and have sunk them-about 9 feet, where we have brokensome good lead work; but the water was found to be so much as to compel us to abandon these trials. We are now rising on the lode in the back of the 24 fm. level, where we have brokensome good lead work; but the water was found to be so much as to compel us to abandon these trials. We are now rising on the lode in the back of the 24 fm. level, where we have brokensome good lead work; but the water was found to be so much as to compel us to a

WHEAL TRELAWNY MINING COMPANY.

WHEAL TRELAWNY MINING COMPANY.

A general meeting of shareholders was held at Webb's Hotel, Liskeard, on Tuesday, the 8th inst.—Charles Chippendale, Esq., in the chair.

The accounts for December, January, and February, being first duly examined, were allowed and passed, showing—By sale of lead ore, 51751. 5a. 5d.; by Wheal Trelawny adventurers, for use of engine and water to dress their ores, 601. 10s.; tribute ores forfeited and a fine, 8l. 17s. 5d.—52441. 12s. 10d.—Dec. cost, 18881. 12s. 5d.; January, 13931. 15s. 6d.; February, 13991. 12s. 4d.—41821.0s. 3d.—showing balance in favour of mine, 10621. 12s. 7d.—By dividend of 3l. per share, 7801.—leaving balance carried to credit of next account, 8321. 13s. 9d.—The following report, from Capts. H. Vivian and J. Kenp, was read to the meeting:—

of 3l. per share, 780l.—leaving manner carried to become and J. Kenpy was read to the meeting:

May 8.—Phillips's shaft is sunk 7 fms. under the 72 fm. level; the ground is still good for sinking; the lode in the 72 fm. level, north of Phillips's shaft, is 5 ft. wide, worth 9l. per fm.; in the same level south the lode is 7½ ft. wide, and worth 10l. per fm.; in the ries, in the back of this level south the lode is 7½ ft. wide, and worth 10l. per fm.; in the ries, in the part looking very well. Trelawny's shaft is sunk 17 fms. under the 39 fathom level, and the ground continues very lavourable for sinking; the lode in the 52 fm. level, north of Trelawny's shaft, is 2 ft. wide, and worth 12l. per fathom; all the stopes in this level are looking well. The stopes in the back of the 42 fathom level, north of Trelawny's shaft, is 2 ft. wide, and worth 12l. per fathom; all the stopes in this level are looking well. The stopes in the back of the 42 fathom level, north of Smith's shaft, is 4 feet wide, and worth 3l. per fathom; in the same level north the lode is 2 feet wide, and worth 3l. per fathom; in the same level north the lode is 2 feet wide, and worth 3l. per fathom; in the same level north the lode is 2 feet wide, and worth 3l. per fathom; in the same level north the lode is 2 feet wide, and worth 3l. per fathom is the 30 fathom level, north of Smith's shaft, is small at present, but we hope to have a charge here soon, as the ground is mare favourable; the lode in the winze under this level swath is 2 ft. wide, wanth 6l. per fm.; this winze is sank 9 fms. under the 30 fm. level. We have commenced driving two levels from Wheal Trehane boundary—viz.: the s5 and 55. In the 45 fm. level the lode is 1 ft. wide, and worth 3l. per fm. In the 55 the lode at present is small, but we expect an impresement here shortly, from the appearance of the lode gone down before it. In conclusion, we begin that, from our present prespects, we calculate a continuance of our later returns.

CRADDOCK MOOR.—At the two-monthly meeting, held at Liskeard, on the 26th of April, the accounts were presented, showing:—Salance of last account 94.10s. 11d; call made at last meeting 524. 15s—124. 15s. 11d.—Labour cost for January and Fobrary. 354. 7s. 9d.; materials, 44. 13s. 7d.; leaving balance in favour of adventurers, 224. 3s. 7d. The accounts were passed, and a call of 3s. per share made. The following report was presented:—"Since our last meeting our operations have been confined to the driving north on the cross-course, which is now extended upon about 17 fms. in Craddock Moss sett, and about 32 fms. in all. We have likewise, since hast meeting, cit a 10de about 7 ft. big.

ed of spar, gossan, and spots of yellow ore. think it to be Dunstan's lode, in West Car m., while Vivian's lode is about vertical. neral cha-about 3 di, in West

contingues or spar, gossan, and spots of yellow ore. From its underlay there is about 34 ft. in a fm., while Vivian's lode is about vertical. Those lodes in the 17 m. level, in West Caradon. Its underlay there is about 34 ft. in a fm., while Vivian's lode is about vertical. Those lodes in the 17 m. level, in West Caradon, are about 21 or 22 fms. apart, so that the underlay of Dunssan's will heave its back several fms. south of Vivian's, in this shallow level, in Craddock Moor. I would recommend to continue driving morth on this cross-course, to cut Vivian's and Gilpui's lodes—then we shall be better able to judge where to sink to advantage.

EAST WHEAL ROSU.—The following is the statement of accounts for Jan. and Feb. :—Balance of last account, 27271. 73. 4d.; sale of lead ore, Jan. 5, 1680, 3s. 1d.; ditto, Jan. 19, 18704. 118. 11d.; ditto, Jan. 27 (Oxnam's), 3812. 4s. 4d. ditto, Seb. 134. ditto, Jan. 19, 18704. 118. 11d.; ditto, Jan. 27 (Oxnam's), 3812. 4s. 4d.; ditto, Feb. 28, ditto, Gilto (Rorth Wheal Rose), 4404. 12s.; Carglii advonturers, for supplies, water-charge, agency, &c., 2604. 14s. 10d.; ditto, for our three-four these front, Jan. and Feb., 5602—136. 5s. 3d.; part proceeds of lead ore sold on the 2 do of latch, raised in Feb., 5602—136. 5s. 3d.; part proceeds of lead ore sold on the 2 do of latch, raised in Feb., 5602—136. 5s. 3d.; d.—To Jan. costs, 1966; f. 3s. 7d.; surgeon state, 1360. 4s. 5d.; c. col., 2504. 1 locome tax, 1300.; dues, 5604. 7s. 3d.; Stanmary Court dues, 161. 17s. 11d.—By dividend at 280. per share, 32004. : leaving balance in land, 27284. 6s. 3d. 18c. 3d. 4l. Liskeard, on the 26th of GonaMen.—At the two-monthly meeting. held at Liskeard, on the 26th of

income tax, 1504. † dies. 5604. 7s. 3d.; Stanmary Court dies. 163. 17s. 11d.—By dividend at 251. per share, 35004. ! leaving balance in hand, 27284. 8s. 9d.

Gonamena.—At the two-monthly meeting, held at Liskeard, on the 26th of April, the accounts were presented, showing:—Labour cost for January and February, 733. 6s. 161. materisis, 4. 5s. 4d.—277. 5s. 3d. † palance of last account, 511. Pps. 7d. : leaving against adventurers, 254. 5s. 10d. The accounts were passed, and a call of 10s. per share made. The following ryport was presented:—"Since the last meeting we have driven east on Taylor's lode about 5 fms. We have had a'kindly lode part of this distance, and have saved a little ore from it; but the end is now poor, though not without ore. We have cut a lode in the 38 fm. cross-cut, about i ft. big, and containing ore when first cut. If appears to become smaller the further we drive on it, and the underlay is so great that we doubt whether it is a branch or the main lode, and are accordingly now driving north again in search of more lode. West Caradon adventurers have brought their 60 fm. cross-cut to within a short distance of our sent, and it will be advisable as soon as possible to continue it on to Taylor.s lode, to explore it 22 fms. deeper than it has yet been seen."

Levant.—The statement of accounts for Jam. and Feb. shows—By balance last account, 6494. 19s. 10d.; copper ores sold, 16504. 10s. 9d.; carriage ditto, 1612. 18s. 8d.; tim ores sold, 48964. 18s. 3d.; carriage (ditto, 1441. 17s. 6d.; destings, 994. 18s. 7d.; bill twice charged, 18d. 18s. 4d.—214314. 17s. 7d.—To January cost and subsist, 13754. 17s. 6d.; February ditto, 13424. 11s. 8d.; tributers' pay, 18d. 17s. 6d.; deotor, club, pursership, &c., 904. 8so. 0d.; carriage of ores, 1164. 18s. 8d.; coils, 2174. 0s. 2d.; merchants' bills, 883. 8s.; stamping and dressing, 44d. 11s. 5d.; ford's dues, 84d. 13s. 4d.; samples, fees, weighing, &c., 204. 11s. 5d.; freight, carriage, &c., 15d. 18s. 9d.; sundries, 16d. 13s.—By dividends, 19204. 1 leaving

SOUTH WHEAL FRANCES.—The following is a statement of accounts for February and March:—To labour cast, 12021. 10a. 5d.; merchants' bills, 8871. 15a. 11d.—29001, 6s. 4d.—By copper and tin ores sold, February and March, 36021. 5s. 10d.; deduct for lord's dues, 2404. 3s.—33621. 2s. 10d.: showing profit of 12711. 16s. 6d.; add balance in favour of last account, 6912. 9s. 4d.—19533. 5s. 10d.—By dividend this day declared, of 101. per share, 12401.: leaves balance in bankers' hands of 7234. 5s. 10d.

lance in favour of last account, 691t. 9s. 4d. — 1963t. 5s. 10d.—By dividend this day declared, of 10t, per share, 1240t.: leaves balance in bankers' hands of 723t. 5s. 10d.

SOUTHERN AND WESTERN MINING COMPANY OF IRELAND.—The directors of this company, having made four ineffectaal attempts to collect a sufficient number of shareholders to form a legal general meeting, have forwarded a copy of the report which they intended to have submitted to the shareholders. The call made the 3d of July not having been responded to, the expenditure has been limited as much as possible; but some is still going on, from which, however, the company cannot derive any adequate benefit. The directors have been unable fully to test the Gurtivallig Mine, or to agree for others, to which their attention has been directed as likely to prove beneficial, and though they are reluctant to coerce unwilling shareholders to pursue an object against their inclination, they are equally averse to impede or injure those who wish to extend the operations as originally contemplated, and who entertain confident hopes of ultimate success. In order to meet the views of both parties, they have consented to permit the transfer to the secretary, on behalf of the company, of all shares on which half the call (say, 3s. per share) is, or shall, be paid before the 21st May, as that sum they calculate will be required to discharge the existing liabilities, and provided such transfer shall be executed on or before the 1st June. Such shareholders as do not pay, or transfer, according to the above arrangements, will be considered as intending to continue shareholders, and must, of course, be prepared to pay up the full call without delay, and to aid the directors in such further measures as may appear to them necessary to carry on the business of the company with the views originally intended and provided for by the charter and subscription contract.

WEST CARADON.—At the two-monthly meeting, held at Liskeard, on the

WEST CARADON.—At the two-monthly meeting, held at Liskeard, on the 26th April, the accounts were presented, showing—Materials sold, 71. 11s. 6d.; ores sold in Feb., including carriage, 22971. ivis. 7d.; ditte March, 28537. 9s. 6d.; (less lord's dues, 3081. 16s. 104.)—48501. 9s. 9.— By purser's agents, and count-house expenses, 827. 6s. 2d.; engine-men and reporting engines, smith's work, and carpentry and sawing, 1761. 13s. 7d.; tribute and tutwork (exclusive of materials), 1648. 10s. 6d.; surface-work, tramming, landing, &c., 3391. 9s. 8d.; charges on ores, &c., 5611. 7s. 6d.; Devon and Cornwall Bank charges, 877. 6s. 3d.; parchall rates, 281. 2s. 9d.; doctor and club, 747. 16s. 6d.; naterials, 8542. 2s. 7d.; sundries paid in labour cost, 171. 7s.; canal dues on ores, for 1484, 1834.; calls on 35 shares in East Wheal Agar Mine, 666. 8s.; property tax on profits, half-year, 304. 2s. 10d.: leaving balance, being profit, 7367. 10s. 5d.; add balance of last account, 1176. 12s. 2d. =19134. 2s. 7d. —By dividend of 2f. 10s. per share, leaves balance in hand, 12734. 2s. 7d.

WHEAL RENNY—A general meeting of advantages was habled the officer.

in hand, 1273. 2s. 7d.

WHEAL BENNY.—A general meeting of adventurers was held at the offices, Ring-street, Cheapdae, on the 10th instant.—Peter Davey, Esq., in the chair.—The purser's circular convening the meeting, and also his authority to the secretary (Mr. Corfs) to act for him in his absence, according to the rules of the Cost-book System, were read; the minutes of the committee of the 10th April were also confirmed.—The report from the agent (which will be found in another part of the Journal) on the state of the mine, dated the 9th inst., was read, which held out satisfactory prospects for the future. It was resolved, that six miners be employed in driving to the lode in the 30 im. level, and four men on the cross-cut south; and a call of 36s. per share was made, of which 10s. per share was made payable in seven days, and R. in 28 days. It was also deemed essenable that the works of the mine should be inspected by a competence person, and capt. Lean, of Holmbush, was requested to undertake that duty without delay.

WHEAL LOYELL—A general meeting of shareholders was held, on the 27th

25998. 8s. 9d.; sundries, 156. 2s. 6d.=2614f. 11s. 3d.; leaves balance against adventurers, 812f. 5s. 9d.

WHEAL MARY CONSOLS.—At the two-mon thly meeting, held at Liskeard on the 27th of April, the accounts were presented, showing—By purser's, agents', and carpentry and sawing, 85f. 18s. 3d.; tribute and tutwork (exclusive of materials), 5900. 7s. 5d.; surface-work, tramming, landing, &ce. 88f. 10s. 9d.; charges on ores, 221f. 8s. 10d.; doctor and club, 12f. 14s.; materials, 299f. 18s. 9d.; sundries paid in labour cost, 12f. 7s. 6d.—1324f. 9s. 2d.—Sale of materials, 39f. 0s. 3d.; copper ores sold in Feb. and March (less 299f. 1st. 6d. 1st. 6d WHEAL MARY CONSOLS.—At the two-mon thly meeting, held at Liskear

HARRIS'S LIGHTNING CONDUCTORS.—In the House of Lords, last night, the Earl of Wilton moved for certain returns relating to her Majesty's ships fitted up with Sir W. Snow Harris's lightning conductors, and also of the number of ships struck by lightning during a certain period. The Earl of Minto having entered into explanations on the subject, after a few words from the Earl of St. Germans, the motion was understood to be agreed to.

STEAM COMMUNICATION WITH AUSTRALIA.—In the House of Commons, las night, in reply to Mr. Scott, Sir F. T. Baring stated, that the subject of steam communication with Australia was under the consideration of the Admiralty

BLACKBURN, CLITHEROE, AND NORTH-WESTERN.—This company have jus adopted the novel plan of issuing a printed list of all their shareholders in arrea of calls, in accordance with a resolution of the last general meeting. It con tains the names of 144 persons, who hold 4405 shares; the total amount o arrears being 43,5317.

LONDON AND NORTH-WESTERN RAILWAY.—The directors of this company are, on some of their branches, laying down a single line of rails, with the electric telegraph, in order to economise expenditure. We understand the company will, by this wise proceeding, save about a quarter of a million sterling AND RAILWAY.—Mr. Ellis, M.P., has been elected chairman, and Mr. Beale deputy chairman of this company.

Wight Treman Lad and Shure Mire is situated in the centre of Wheel Tre-lawny, and has within its limits about 100 fms. of ground on the course of the Wheel Trolawny lode. This limits about 100 fms. of ground on the course of the Wheel Trolawny lode. This limits about 100 fms. of ground on the course of the Wheel Trolawny lode. This limits about 100 fms. of ground of the development of the adventures; and there is every prospect of its confinuing to pay dividends. The water charges are only 271. Ios. per mouth—power being supplied from the Wheel Trolawny engine for this sum. This mine is 56 fathoms deep; the lode in which this mine is being wrought, passes through Wheel Trelawny, Mary Ann, Trehane, and the North Trelawny Mines, and is one of the finest lodes sever discovered in Cornwall or Devon; and may be truly said to stamp on this district the appoliation "argentiferous." There is every reason to believe, both from the nature of the country, the proximity to the grantic range of Caradon, which lies about four miles to the north of this lode, the fact that large cross-courses have been met with in prosecuting the copper misses in the Caradon district, of which mines they appear to be the very life blood. Near them it is that the vast deposits of copper discovered in West and South Caradon have been found (of which more hereafter), and which cross-courses, as they enter the killse, experience prove forms lead lodes. Tracing the course of Tretawny lode, there is little reason to doubt that it is the great cross-course which passes through Wheal Gill Copper Mine. Mining in this district is in its infance.

the great cross-course which passes through Wheal Gill Copper Mine. Mining in this district is in its infancy.

Birch Tor and Verifer.—The shallow adit is driven 30 fathoms further east than the deep adit level, and is going into an untried piece of ground, which will give full 50 fms. of backs. In the stope above the end is a lode, which is being taken away at 10s. in 1/c tribute; the end is not under this stope by nearly 3 fms. The deep adit has been for many months idle; but a rise having been made for ventilation, this end will be resumed at the next setting day. In the shallow adit, which is 15 fms. above the deep adit levels the whole of the ground has been taken away at a tribute varying from 3s to 13s. day. It is more than 12s fms. The deep adit she can driven I feet, and the 16 fathom level was the best part.—In Frideaux shaft, which also level in 12s fms. I fms. above the deep adit she been commenced: the deep adit is a been driven I feet, and the 16 fathom level was the best part.—In Frideaux shaft, which has been controlled much 11s, but there is, in the sump, a splice commenced: the deep adit is a feet is the shaft is the deep adit shaft and the probably the shaft is shaft as been sum 22 fms. from the sum of strain in the end.—Old Vine the salt, and has a been sum 22 fms. from the sum of strain in the end.—Old Vine the salt, and has a seen sum 22 fms. from the sum of the salt is a fms. The shaft intersected the lode which underlays about 6 in, per fm., 2 fms. under the salt, and has averaged from 12s, to 15s, her fathom gradually improving in depths and in the bottom of the shaft it is considerably the best down where 2s fms. In the sum of the salt is shaft and been out for the purpose of resuming the shaftom. The level weat

NUMBER A. The mines in this vicinity are proceeding satisfactorily. A fine lode exists at Coombe. It is expected the Holme Park will shortly go on. There eat company going to try experiments in the manufacture of this article here.

MEAL FARNOL.—In the 32 fm. level, east from Burnell's shaft, there is a tolerably good lode. The lode in the 47 fm. level is producing ore, but is not rich. In the 63 fm. level cast there is a kindly lode, which is improving. In the 62 west the end is in a slide or cross-course, which is encouraging. At the general meeting, on the 30th, there will be funds sufficient to pay 11, pur share, and leave upwards of 4006. In the purser's hands. East Comparate.—The Rix Hill lode, which has not, for the last forinight, looked quite o well as heretofore, has, within the last week, considerably improved.

THE VIRTUOUS LADY MINE has, we learn, been again set to work.

PLYMOUTH WHEAL YEGLAND.—The north lode has been let, to sink the a ribute. On the south lode the western part of the stopes is worth about 61. p he eastern past 104.; whilst the lode in the shaft is worth full 151, per fm.

ASHBURTON.—The extensive slate quarries at Ricca are going on briskly. From the superior quality of the slate, which is now taken from a depth of nearly 200 feet in the quarry, it is sent off per railway to Exeter, London, and other towns. This undertaking affords employment to a number of men, principally from the Welsh quarries. The tunnel has been recently improved, under the superintendence of Mr. G. Siepherd, C.E., of Plymouth. It is reported that the extensive grantic quarries at Haytor have been taken by a company in London, and will be shortly worked. The excellent quality of the Haytor grantic, some years since, attracted unusual notice in London, as well as in several other cities and towns in England. Its colour and durability is not to be excelled. The line of railway from the quarry to Teigngracs, will be again used, and it will afford employment to a number of labourers. The Haytor rocks are situated about five miles from Asiburton, and from their summit views of the English channel from Plymouth Sound to Portland Rocks can be distinctly seen, with the countless towns, churches, and villages, through the South of Devon. To the tourist it will afford a pleasurable visit.

"..." We received the following report by this morning's post:—
EXMOR WHEAL ELIZA.—The mining agents report—Since our last, the
nunter lode, in the 24 fm. level, has been cut through, which is 3 ft. wide; it is comsed of a beautiful gossau, spotted with rich copper ore. We hope to cut the north lode in
er or six weeks; we are warranted to expect, it orey if not, tell, and from the indicano on the south lode, in the level above, it may be fairly presumed there will be a good

DEATH OF CAPT. JAMES BRYANT. -It is with deep regret we have to announce the demise of this gentleman, the much respected manager of Wheal Trelawny Mine, near Liskeard. This unexpected event took place on Wednesday last, the 9th inst., after a few days' illness. He was much esteemed by his personal friends, as a sound practical miner, and his decease will be long and deeply regretted by all who had the pleasure of his acquaintance; whilst by his wife and family the bereavement will be most severely felt.

by his wife and family the bereavement will be most severely felt.

WHITWORTH COLLERY COMPANY, DURHAM.—At the COURT of Bankruptcy, yesterday, Captain John Charritie, a steel merchant, of Trinity-square, Southwark, and late of the Honourable. East India Company's service, appeared to pass his last examination. The report of Mr. Pennell, the official assignee, includes the subjoined statement. The bankrupt commences his balance-sheet on the 3d of December, 1846, with a capital of 85021, and has subsequently taken off as losses 70171, and doubtful debts 20004, thus disposing entirely of his capital. His unsecured debts are now 17914. The bankrupt also returns liabilities to the amount of 80,0904. This liability has been incurred as one of the partners of the Whitworth Park and the Trinder Colliery Companies, in the counties of Durham. The assets are, property, 3211; and doubtful debts, 20004. It appears that the bankrupt's partners in the Whitworth Colliery, consisted of eight in number, all of whom have either become bankrupt or absconded. The bankrupt passed his examination.

ACCIDENTS.

ACCIDENTS.

South Boskear.—On Tuesday, Capt. John Dankin received some severe injuries on the head and body, in consequence of the ladder by which he was ascending giving way, and precipitating him to the depth of from 6 to 7 fns.

Dudley.—James Downing dreadfully fractured and dislocated his right wrist—pieces of the bones of which were compelled to be removed—by his arm being draugged by the connecting rod among the machinery of an engine at Bumble Hole Colliery, under the British Iron Company, which, it appears, the poor man was attending, during the night, for his brother, who is the regular engineman.

West Bromwich.—Michael Finnon and Thomas Horton met with their death while engaged in loading a skip in Mesars. Botteley and Tildesley's pit, at Bill Hay Colliery. Having gone a short distance into the workings for something they required. a large quantity of coal fell, and completely baried them. On the coal being removed, Finnon was found to be dead, and Horton so dreadfully injured that he died in an hour afterwards. There had been some rumour that the pit was not properly secured, but there did not seem any grounds for trumour that the pit was not properly secured, but there did not seem any grounds for trumour that the pit was not properly secured, but there did not seem any grounds for trumour that the pit was not properly secured, but there did not seem any grounds for this assertion, as the batties of the pit were represented to be steady experienced men.—Birningham Journal.

Bilaton.—As Thomas Hands, a banksman, was at work on the pit bank of Moseley Col-

Bildon.—Birmingham Johnan. was at work on the pit bank of Moseley Colliery, in the act of removing the tackling chains from a skip that had just been drawn up the pit to the hovel close by, and as he was drawing the chains along the railroad, on of the hooks caught one of the rails, and whilst the deceased had his back to the pit, pulling the chain, the hook came off much easier than he expected, and he fell backwards into the pit with the tackling chains in his hands. He was brought out quite dead.

Tipton.—As Joseph Wasdell, superintendent of the machinery at Lord Ward's furn Dudley Port, was engaged in repairing one of the fly-wheels, it unexpectedly made volution, and he fell into the pit in which it works. He was quickly extricated, but injuries he had received were of so shocking a nature, that he died almost immedia after being released.

after own recessed.

Oldbury.—Mr. James Waterhouse, butty, was seriously injured by a fall of coal at Messrs. Finch and Whitchouse's Colliery. The coals fell upon his neck, and the poor man is suffering from paralysis in consequence, but hopes are entertained of his recovery—George Saunders, while in the act of descending a shaft with a quantity of timber, at Messrs. Bate and Robbins's Colliery, owing, it is supposed, to the timber getting displaced, the poor fellow, in endeavouring to reinstate it, slipped out of the skip, and fel to the bottom of the shaft. He expired in a few hours afterwards, from injuries received

es Rees, a miner in the employment of the Llynvi Iron Compa great mass of earth, which fell from the top of the mine. There

—An explosion of fire-damp took place at the colliery of Messis. Byrom, Taylor m, on Wednesday, the 2d inst., by which two persons were seriously injured. Little Lumley, Durham.—J. Speed, aged 15, was crushed to death between a tub and the props of the pit in the Harbour House Coillery.

s. — A frightful accident occurred at one of Mr. Russell's pits to a respectable and lad, named Elijah Shearne, aged 16 years: he was in the act of ascending the nit R on the carriage (on which was a tram of small coals), which, it is supposed, caught in the side of the pit, turning it upside down, when the tram and boy fell to the bottom. When picked up, life was extinct, and his body dreadfully mutilated.——A poor fellow, between the machinery of the engine and the wall, and was crushed to death! fell

NEW PATENTS.

G. E. Donisthorpe and J. Whitehead, Leeds, manufacturers, for improvements in preparing, combing, and backling fibrous matters.

S. Wilkes, Wednesbury Heath, Wolverhampton, brass founder, for improvements in the manufacture of knobs, handles, and spindles for the same, for doors, and other purposes, and improvements in locks.

R. Sutcliffe, fille, near Bradford, York, cotton spinner, for improvements in machinery or spinning cotton, silk, and other fibrous substances.

G. H. Dodge, Manchester, manufacturer, for certain improvements in machinery for pinning and doubling cotton yarn and other fibrous materials, and in machinery or aparatus for winding, recling, bailing, and spooling such substances when spin.

W. Newton, Chancery-lane, civil engineer, for improvements in the Jacquard machine. Being a communication).

DESIGNS FOR ARTICLES OF UTILITY REGISTERED.

P. P. Bourjeaurd, Davis-street, surgeon, elastic pessary. Simons, Birmingham, fastening for trouser straps, and other articles of dress. and H. Hutchinson, Sheffield, dilator for syringe.—Mechanics' Magazine.

* Cold-blast, free on board in Wales.

REMARKS.—The iron market generally 'continues in the same depressed state we noticed in our last, and a further reduction in prices have been submitted to. Scottas pig-Iron has again receded, and sales have been made during the week at 44s. 6d. to 44s.h and 43s. 6d. for mixed No. cash, in 10 days, and No. 1 Gartsherrie, 45s. 6d. Spelter, dull of sale. In other metals no alteration.

LIVERPOOL, MAY 11.—Iron continues dull of sale, and a further decline to a small extent has to be reported. For common bars, 64. is now the highest obtainable rate; whilst for cargoes in Wales, the rates are nominal, with a wide range from 54. 15s. to 54. 7s. 6d.—Saffordshire iron of all descriptions can be bought on easier terms, although no settled reduction in prices can be adduced.—Scotch pig-iron continues to decline slowly, but incessantly; and there are sellers to-day for 4ts. 6d. for mixed numbers in the Clyde.—Copper is steady and in fair demand.—Block tin is reduced 6f, per ton.—Tin plates are a shade lower, with a small demand.

GLASGOW, MAY 10.—The continuance of political disturbances on the continent has a very depressing effect on trade generally; and pig-iron, so much does it now depend on foreign demand, is particularly influenced by it. In consequence of time contracts now failing due, large quantities of iron are brought into the market; and, as there are but few buyers, the holders are obliged to submit to lower prices. In the course of yesterlay fully 4000 tons of mixed Nos. were sold at 44s. To-day there was a sale at 43s. 6d. cash. Iron delivered in the Forth, 46s. cash.

THE SCOTCH IRON TRADE.

THE SCOTCH IRON TRADE.

Sia,—I read with interest the communication of the Committee of the Metal Brokers' Association, and also that of your correspondents, Messrs, Ferguson & Rhind, onthe subject of the make and exports, with the home consumption of from in this locality, and consider that whatever difference may appear on the face of the statements put forward, that much benefit will arise from the publicity thus given, and enable the consumer and manufacturer to form something like an estimate of the trade, as well as the capitalist, and those interested in other districts. It has been too long the compliant that, in the several mining districts, there has been a system of concealment—I will not any 'delusion, or misrepresentation: but I believe it is universally known and generally acknowledged that, with the exception of just so much as the knot of frommasters think proper to make public at their quarterly meetings, the public as kept in the dark; while it is equally motorious, that directly they leave the meeting and return to their respective works, the clerks are directed to communicate with parties, and ofter pigs or bara, as the case may be, under the regulated price as agreed upon. In addressing you on the subject, I am only desirous of recording my opinion, in common with others, of the usefulness and advantage of information of this nature, at the same time that, with the little knowledge I myself possess on the subject, I would beg to correct one or two errors into which your correspondents appeared to have fallen.

In the first place, the number of furnaces in blast during March, 1849, was 103, and not 105—Castlehill, nothing in blast, until towards the end of that month. In the statement of the 12th uit, of Mesars, Ferguson and Rhind, the decrease of shipments, during the first three months of 1849, compared with the same period in 1848, is put down at 25,067 tons; whereas, from authentic accounts, the shipments will be found to have decreased only 6834 tons—thus making a difference, or error,

CONTRACTS FOR COAL TO THE MEDITERRANEAN.—The Board of Admirally have given notice that, on the 22d inst., they will be ready to treat for delivering, at Gibraltar and Malta, the undermentioned quantities of coal, it for the service of her Majesty's steam-vessels:—Gibraltar, 2000 tons; Malta, 10,000 tons. In consequence of the present unsettled state of affairs in Italy, Naples, Sicily, Austria, and Hungary, the British Government is preparing to have a strong fleet in the Mediterranean, and several steam-vessels are now fitting out with expedition to join the squadron at Malta, so that, in all probability, the above contract is only a small portion of what will be required for the service. This is the largest contract that has been amounced for some time to that quarter; and it is to be hoped that a fair competition will be allowed by the department of the Storekeeper-General of the navy, so that all may have a chance, and not confined to the few monopolists who have interest at head-quarters. The Government contracts, as well as those of the East India Company, have hitherto been too partial; there is, however, we are glad to find, a little reform in these matters, in consequence of the repeated representations that have been made by the coal proprietors, all of whom ought to have justice done to their tenders. The commissioners, we know, are not bound to accept the lowest tender; but, at all events, they ought to make the choice of a "medium," as the quality of the coals contracted for is not always the best offered, and at a far less expense to the public.

The board will also receive tenders for supplying the Royal Military Asylum, Chelsea, with 420 tons of good Newcastle or Sunderland coal, to be delivered on the 18th inst. and 30th Sept. next.

Coal for Addm.—The contract for 3000 tons, on account of the East India Company, to be delivered at Aden. on the south coast of Arabia, for the me

COAL FOR ADEN.—The contract for 3000 tons, on account of the East India Company, to be delivered at Aden, on the south coast of Arabia, for the use of their steam-packets, is expected to be strongly contested on Wednesday next. CONTRACT FOR BRITISH IRON.—The Finance Department of the Home Committee, at the East India House, will be ready, on Wednesday, to contract with parties willing to supply them with British iron.

We noticed a few weeks since the introduction of attacked as a substitute.

We noticed, a few weeks since, the introduction of slate slabs as a substitute for the Yorkshire flagging used in forming the footways of our streets, and which are likely to be largely employed. We have had forwarded to our office a specimen of stone from a quarry, called Port Tryddyn, near Tremadoc, in North Wales, of much the same colour and properties as the Yorkshire, which is found in beds, varying from § in. to 14 in. in thickness, amongst which there are large quantities of slabs found, of 2 inches thick, smooth and ready for use as footway pavement, with the exception of their being required to be squared, and which, in consequence, can be supplied in London at a very much less cost than anything now in use for the same purposes. This quarry is on sale.

Anything now in use for the same purposes. This quarry is on sale.

Mixes.—Notwithstanding an apparent duliness in the mining share market during the week, there has been, upon the whole, we find, a fair proportion of busi ness transacted. Inquiries are being made for shares in several mines, which are held back for higher prices. West Caradon, West Buller, South Wheal Basset, South Frances, and Condurrow, are among those sought for. Holmbush is represented to have improved, the Flap-jack lode having been cut near the great cross-course, producing about 2 tons per fin. A large number of Camborne Consols shares have changed hands within the past few days, and we learn the prospects of the mine are highly flattering.

Shares in the following mines have changed hands during the week: —East Wheal Rose, Devon Great Consols, South Wheal Frances, South Tolgus, West Seton, West Tolgus, Tincroft, Trelawny, Trehane, Bedford United, Camborne Consols, Heighnston Consols, Mendip Hills, Tretchellan, Mary Ann, Cwm Erfin, Holmbush, Esgair Lli, Tamar Consols, East Tamar, South Tamar, &c.

The annual meeting of the Devon Great Consols Mines was held on Monday. The report furnished by the directors is a perspicuous and explanatory statement of the proceedings during the past year, in which may be observed a laudable exercise of prudent measures against the vicissitudes of future operations. The managing agent's report of the present position and prospects of the mines is characteristic—an elaborate, voluminous, and, at the same time, a highly interesting document, abounding inserts vorkings. The balance-aheat of the company is made up to the let March, and must prove the mest gratifying portion of the whole, to the shareholders, inasmuch that the profits during the year will enable the directors to declare an increased vicidend, with a balance in hand of 17,2571. 17a, and ore billed us the 23d instant, amounting the 10,0244,18a, with an increase of 16,0604. Isa. Id. in the balance of assets over liabilities during the year. A dividend of 71 tos. per share or 2000, was declared, for January and Fe

have not been numerous.

The Imperial Brazilian Mining Association have received dispatches to the 23rd February, advising remittance of about 90 lbs. of gold (value 4000£) which is daily expected. The returns from February 13th to 22d are—Gongo, 4 lbs. 2 ozs. 2 dwts.; Bananal, 9 lbs. 6 ozs. 15 dwts.—total, 13 lbs. 8 ozs. 17 dwts. The total from the 1st January is 56 lbs. 1 oz. 18 dwts. The manager's report of the underground operations is not very encouraging, although we consider the prospects are more favourable than last advices. We learn that the appointment of Captain Joel Hitchins, to supersede the present commissioner has recently taken place; we, therefore, look forward with much interest to the period when he will commence his operations at the mines, deeming this selection, from his long ability and practical experience, to be a landable act on the part of the directors, and considering him the most probable person to bring this valuable property into profitable working.

By letters received from South Australia, we learn that the Kapunda Mines are now in an efficient working order. The shafts are down to the 30 fathom level, and preparations being made to commence the sinking to the 40. The ores hitherto selected have been such only that would pay for transmission to Eagland; but the arrangements that have been made for smelting copper ore in the colony will enable the proprietors to turn to advantage the immense quantity of lower per centage ores, which they can readily supply, and, consequently, work to a large monthly profit. A smelting company has also been established in Van Diemen's Land, where coal can be raised in abundance at 2s. 6d. per ton.

In consequently accuments the Copiapo report late last week, we omitted

established in Van Diemen's Land, where coal can be raised in abundance at 2s. 6d. per ton.

In consequence of receiving the Copiapo report late last week, we omitted to give a summary of the gold and silver mines of that company. We find that at the Al Fin Hallada Silver Mines, in taking down the lode which had been desued for 3½ varas, about 9 to 10 tons of silver ores were broken, estimated worth 6000L; the lode in the bottom and end was considered then of a richer quality. The San Jose del Carmen is equally productive, but the scarcity of water and labourers have retarded the operations, inasmuch that the value of the produce cannot be ascertained for a time. In the Mercedites, Carmen Alto, and Loreto Mines the lodes are represented as being rich and productive. The produce of the Al Fin Hallada and San Jose del Carmin Mines for the month of February to the company's proportion is about 7 tons of silver ore. In the Esperanza Mine, these lodes form a junction at about 30 fathoms in depth, where a bunch of gold ore is expected; from some samples tried, a produce of 5 ounces in the ton has been realised. The Mercedites and Santo Domingo Mines are producing rich gold ores; in the former, the lode, or veins, are from 2 to 3 ft. wide, with very superior samples. Other setts, in which the company are more or less interested, may be considered of great importance. These mines must prove a valuable acquisition to the company, and will, no doubt, soon place them in a position of resuming dividends.

The Peninsular and Oriental steam-ship, Iberia, arrived at Southampton on Saturday,

The Peninsular and Oriental steam-ship, *Iberia*, arrived at Southampton on Saturday, the 5th, bringing on freight 11 packages of specie. On Taesday morning, the *Euxine*, belonging to the same company, arrived at Southampton, having on freight 20 packages of specie—value, \$6,000?.

HULL, THURSDAY.—We have had dull dragging markets for shares, and the fall on seriain stocks during the last few weeks has been to a really serious extent. To give an astance, York and North Midlands, East and West Riding extensions (25t. paid) have fallen ertain stocks during the last few weeks has been to a reasy sections (254, paid) have fallen instance, York and North Midlands, East and West Riding extensions (254, paid) have fallen nearly 104, per share since the 1st March last. We presume there is a point at which share-buying will be profitable, and it probably will not be far distant.

MINR VENTILATION—IMPORTANT INVENTION.—At Gelly Gaer Colliery, a ventilator, upon an entirely new construction, invented by Mr. Brunton, has been erected under his superintendence, for the special purpose of testing its power of rarifaction. On Friday, the 4th inst., Thomas Powell, Esq., of The Gaer, proprietor of the colliery, together with several practical and scientific gentlemen, attended to see the machine put to work, and to ascertain its capability. The experiments were recorded and calculated by Mr. Samuel Dobson, mineral agent to the Hon. R. H. Clive, M.P., and Mr. E. Scott Barber, mineral agent to Sir Charles Morgan, Bart. The experiments were also witnersal agent to Sir Charles Morgan, Bart. The experiments were also witnersal agent to Sir Charles Morgan, Bart. CORNISH STEAM-ENGINES.

The number of pumping-engines reported for the month of April is 23—the quantity coals consumed being 2127 tons lifting, in the aggregate, 20,000,000 tons of water 10 thoms high—the average duty of the whole is, therefore, 53,000,000 lbs. lifted 1 foot high y the consumption of a bushel of caol.

[We shall give the particulars in our next.]

CALE OF COBALT MINES AND SMALT WORKS, IN NORWAY.—The Undersigned, Administrator of the Estate of the company carried on under the firm of "Modum Blue Colour Works," gives provisional Notice, that, according to the Order of the Court, held on the 16th of March, 18th, the MODUM BLUE COLOUR WORKS, situate in the ballieship BUSKERUD, kingdom of NORWAY, with all the MINES, BULLDINGS, HOUSES, FOREST, SAW and FLOUR MILLS, &c., appertaining to it, will BE SOLD, BY PUBLIC SALE, in the latter part of the month of June. The subjected information of the maines and works has been principally given by the mining director of the ballicabily, who, under Royal sanction, has for many years directed the operation of the mines and pool works. The time, when, and the place where, the public sale is to be held will, be advertised by the anciloners in due time.

The Administration of Eler, Modum, and Sigdahl,
Möllenhoft, moar Drammen, in Norway, the "9th March, 1849. G. P. RASCH.

Report of Lammers, Director of Mines at Modum Elus Colour Works:— In giving a short report of Modum Blus Colour Works, I shall begin with the m

Report of Lements, Director of Mines at Modum Blue Colour Works.—

In giving a short report of Modum Blue Colour Works, I shall begin with the mines—

1. The district now worked since a number of years is nearly on the height of the Skuttered Firste, and runs from north to south. It comprises a length of about 1400 lachters, and only both ends—viz.: the north and south sides, run under the grounds of other proprietors. The Grange Skatherud belougs to the works. This district is divided into four parts—viz.: 1. The South Mines.—3. The Middle Mines.—3. The North Mines.—4. The Resting Revier (remaining portions). The mines belonging to the latter are the most northerly, and are situate on on the Grange of South. The working of the latter was discontinued in the wonth of April, 1443, as the ore was found not to-be of sufficient quality to work them profitably. Of the South Mines the Magagarud Schürfe, and some other schürfe, lie the most northerly, beyond the grounds of Skutterud, but they have not been worked considerably until the spring of 1848, when they were discontinued, not on account of the orea failing, but as it was considered that the orea gained from them did neither equal in quality nor in richness the ores of the middle and northern mines. The southern mines have yielded a cheap, but goor, and perhaps not so good an ore; the richer ores were rather scarce there. At the southern mines, the client ore were rather scarce there. At the southern mines, the southern mines have yielded a cheap, but goor, and perhaps not so good an ore; the richer ores were rather scarce there. At the southern mines, the main No. 4 is facilitated by the open trench Fortman.

A different case is it with the two remaining parts—namely, the middle and northern mines. These mines are in the richest and most valuable part of the layers of ore; they have yielded nearly all the rich ores which take so prominent a part in the manufacture of the first part of the parts of the first parts of the first parts of the parts of the parts of

1846-47 157 4082 23548 591 46.851 1 56

The mines are provided with the necessary buildings; most of them are good, and well kept in repair. There is a considerable stock of ores now lying at the mines. The quantity cannot be exactly given, as time working countmes. One should be stocked of the horizontal of 16 barrels related to 10 barrels ordinary ore, 7220 barrels copper-holding ore, and 21,316 barrels ore called Snatje, an ordinary kind of ore which is mentioned in the above tables, but may well be taken at a value of 60 aks, or 4 Sps. dollar per barrel. This considerable stock of ores permits an immediate continuation with the working of the crushing or stamping mills, and the easy access to most of the mines the bringing up of fresh cress. The stock will be increased instead of lessened till the time of sale. The work possesses, besides, several schuirfe in the parish of Modum, and particularly at Snarmn.

2. The Poel Water, or Stamping and Crushing Works. The principal stamping works lie mear the Hougfall, where the water of the liter Simon, and the considerable fall, give an excellent and very extensive mechanical power. There are here two buildings for stamping works; the one containing 18, and the other 35 stamps, which have worked in one year 27,000 barrels ore. The stamping works are provided with the necessary works for damming up the water. The work containing 18 stamps is about 10 years old, in excellent order; of the other some part is new, the other old, but still very good, and available for many years to come. Besides these stamping works, four others are driven by a rivulet of the River Snarun, one of which contains six stamps, and three nine transpeaces, with the necessary fittings attached. All these are in excellent condition, but can only be worked during spring, aummer, and autman, when the rivulet and three reservoirs formed by damming give sufficient water power.

3. The melting-house is situate opposite to the stamping works at the Hougfall, on the side of the River Simoa. It is only

The paper specia is at present par with afiver, about 45 specia dollars, equal to £1 berling. So far regarding the proper mining department, but considerable other properties belong to the work. The grounds of the lands are charged at an annual tax of 5 5gs. 2 mark 16 sk., and comprise fosum, Skutterud, and Aslasby. They contain of only excellent and well maintained buildings for the officers, but houses for the aboverse, and school-houses. Amongst the properties of the works should be named the fasten Rinne (a canal for transporting masts and timber), through which passes all the fasten Rinne (a canal for transporting masts and timber), through which passes all the

ree corn mills, and two saw mills. on a revenue of about 1100 Sps. yearly. On the Govern-

ment calculation for the insurance, at the end of 1846, the whole of the buildings belonging to Modum works were valued at 149, 110 Sps. This sum will give the best and clearest idea of the catesat of the works.

The buildings at the mines (mining-houses), miners' rooms, smiths' shop, calcaded, were valued at 55, 5,660
Stamping works at Skutternd sivulet 10,340
Ditto at Hongfall. 10,660
The amelting-house, colour-mills, calcining-house 75,270

The stock of materials and the inventory are of cansiderable value, but it cannot be given with any certainty, as it changes from day to day.

Of the taxes on the work, the poor-rates only are sworth mentioning. These are considerable, but there is every reason to assume they have reached the highest point. The expenses are 1000 to 1600 Sps. per amount. These can be covered by the revenues arising from the canal for carrying timber and the flour mills.

The situation of the works is very favourable; it commands the waters of the Sigdal, and is protected by the extensive woods of that valley against want of burning material. The Simos river offers an easy access to the considerable quantities of firewood required by the works, and places at its disposal, by the high wateriall at Hough during all the year, the extensive water power required for the mechinary of the crushing mills the melting-houses, corn and saw mills. The mines are about one Norwegian mile distant from the works, and joined to it by a capital read, on which the ore can be transported as well during anumer as in winter. The works, situate only three Norwegian miles from the port of Drammen, have an easy export for its produce, nor a difficult one for its supplies of grain and materials. upplies of grain and materials. Inquiries may be addressed to Goodhall and Reeves, London

NOTICES TO CORRESPONDENTS.

We must impress upon our correspondents, the necessity of invariably farm us with their names and addresses—not that their communications should sequently, be noticed, but as an earnest to us of their good faith.

G. B. C. "(Lampeter).—Green tron earth, or hypochlorite, is a very rare mineral, whi occurs in rentiferon, botryoidal, and globular masses; its structure is impalpable, lour siskin green, passing into black and yellow, lustre dull, with a yellow-grey streak, and brittle; becomes brown and black before the blow-pipe, but does not me nor is soluble in mitric acid; it is found at Sayn, in Germany, and Schneeberg, Saxony. According to Schuler, it contains oxide of bismuth, 13-03; silica, 80-94; a mina, 14:65; oxide of iron, 10:54; phosphoric acid, with traces of manganese, 9:62.

An Enquirer" (City).—The weight of iron used in Southwark-bridge is 4585 tons; the span of the centre arch is 240 feet, that of the side arches 210 feet each.

span of the contre arch is 240 feet, that of the side arches 210 feet each.

A Reader "(North Britain) inquires—"What will be the power of a water-pressure engine that is required to lift 131 cable feet of water per minute, a height of 360 feet, the engine working at 4 strokes per minute, and length of stroke 10 feet—that is, the piston moving at the rate-of 80 feet per minute, the diameter of cylinder 20 in,, and the height of the fall, or pressure, 96 feet?—and what quantity of water would be required for that purpose?"—Elgity-nine horse-power would probably be required; the quantity of water must be determined by some one practically conversant with hydran-lica. We give publicity to our correspondent's letter, in hopes that it may attract the notice of some one who will be able to give the information requested.

nouse or some one wao will be able to give the information requested.

J. L." (West Neithead).—We are not aware how many shares are taken up in the mine, and should advise you to apply for information to some respectable share broker. We do not know who the parties are connected with the other mining company. The accounts received from those regions have been lately so variable and contradictory, that due caution should be exercised previous to embarking in any speculation where there is a probability of heavy liabilities being incurred.

G. T." (Sunderland).—The duty on pig-iron imported into Norway is 36 skillings per Skippound of 360 lbs. avoirulpois. The use of coals as fuel for domestic purposes is, in the capital and the fishing districts, becoming everyday of more importance; there is no doubt, in a few years, that the west of Norway will become large consumers.

is no doubt, in a few years, that the west of Norway will become large consumers.

Smelter "(Swansa).—Messrs. Godefroy, Robinow, and Bette are the proprietors of the Elbe Copper Works. At present this establishment is suspended, on account of the Danish blockade. No English ores have ever been smelted there; hitherto they have received their supplies from South America.

'An Engineer "(Bristol).—According to Mr. Craddock, to produce 95-horse power gross with steam, at 115 lbs. per square inch, it would require 1736 lbs. of steam per hour, or 217 lbs. of coals; without expansion, at 18 lbs. per square inch, it would require 14030 lbs. of steam per hour, or 504 lbs. of coals; without condensation or expansion, at 40 lbs. per square inch, it requires 9270 lbs. of steam per hour, or 699 lbs. of coals. The atmosphere is included in all the above pressures.

An asturian "(Gity).—The copper mine at Sams, has been abandoned for some years. A amall blast-furnace was erected there. No trace of it remains, though specimens of he regulius produced are still picked up. The old workings lay about two miles from the road constructed by the late Mr. Aguado, to convey his coals from Sama to Gijon. We do not know whether they have been recently surveyed; but should think that, If they had been of any value, the Austurian, or some of the other companies in the provinces, would have taken them up.

E. A. "(Coventry).—Col. Colquboun, of the Royal Artillery, was one of the first com-

E. A." (Coventry).—Col. Colquhonn, of the Royal Artillery, was one of the first commissioners sent out to Mexico to inspect and report on the allver mines here.

missioners sent out to Mexico to inspect and report on the silver mines here.

L Moure (Rouen).—The timiling of brass pins is commonly thus performed. A vessal is filled by layers of brass pins and plates of tin—one of these plates being uppermost and undermost. The vessel has then a solution of cream of tartar poured in the acid dissolves the tin, which the zinc of the brass preclipitates on them in a reguline state, by which, after five hours' boiling, they are uniformly tinned.

"D. F." (Cornhill).—We do not know exactly the quantity of gold pens exported from America.—A New York paper slates that, hast year, upwards of 1,000,000 were made in that city—800 lbs. weight of gold being used in their manufacture.

"H. F." (Christiania).—The ores of cobalt are torrelated in Storms in furnescent, the ore

in that city—900 lbs, weight of gold being used in their manufacture.

"IF." (Christiania).—The cres of coulst are torrefled in Saxony in furnaces; the aresenical vapours, attaching themselves to the sides, yield the arsenic of commerce. When the oxide or cookils its cleaned of arsenic, it is, known by the name of "artice." The zaffre of commerce is mixed with three-fourths of sand. This oxide, fused with three parts of sand, and one of potash, forms a blue glass, which, when pounded, sifted, &c., forms smalt. The most simple way of obtaining cotait in its metallic state is to reduce it from smalt, by fusing one part of smalt with six of sods.

G. M. F." (Truro).—Glesschite is an exceedingly rare mineral, it being hitherto only found in one locality—Akulliarasiaranuk, in Greenland, imbedded in compact felspar; it is a combination of potash, salles, and alumina, with admixtures of maguesia and the wides of iron and maguesia and the

oxides of iron and manganese.

*S. M. P." (Brighton).—The oldest copper mine at present working is said to be that of Fahluo, in the province of Dalercarlia, in Sweden. Tradition states that it was worked about 1000 years B. C. Records exist proving that it was a flourishing mine in the inith and tenth centuries. The sliver mines at Sala, in the same country, are only partially worked; for many years they have scarcely paid their working charges.

*E. M. L." (Ongrée) shall be attended to in our next Journal.

"T. R." (Organe) small be attended to in our next Journal.
"T. R." (Swansea).—On the continent great quantities of copper ore are calcined in open air, wood being the fuel in general used. From 30 to 120 tons are placed if square or round open kiln, with 2 or 3 fins. of dry wood, and covered with amal when this likhnided, it burns from afortnight to three weeks; it is afterwards mixed we charceal, and reduced in blast-furnaces. The ore is scarcely ever ground, but mer reduced by the state of spalled stuff. But very little care or attention is required this process, after the ore is plied and it; in general one man attends to several his orest tons.

THE MINING JOURNAL

Railway and Commercial Sagette.

LONDON, MAY 12, 1849.

When the few colonial remarks of the 22d of April passed out of our hands, we had not read the interesting debate on Mr. Scorr's motion to inquire into the administration of the colonies. Of course, the motion was practically negatived; for all parties, including the mover himself, saw that they could do nothing but stare at each other, when they came to deliberate on colonial affairs and to surmount colonial difficulties. As well grant a committee to inquire into the course of the equinoxes, or any other subject atterly beyond the reach, and impervious to the regulation, of a Parliamentary committee, as to grant one for the revision or the elucidation of the policy which it is expedient to pursue for the right government of races of men so various and so peculiar as those which people the lands forming the colonial boundaries of this great monarchy. One motion to inquire into the administration of the colonies. Of cours races of men so various and so peculiar as those which people the lands forming the colonial boundaries of this great monarchy. One point in the course of the discussion was brought out with remarkable distinctiveness and effect by the able Under Secretary, who led for the Government on the occasion. It is known to all the world that the Parliament of Great Britain legislates for the colonies; but it is not so extensively remembered that particular enactments, which are distusteful, or constructively injurious to those for whose benefit they were intended, are straightway, and without reservation laid as a matter of conscience at the door of the Colonial Office; and that department has to bear the hoarded resentment, the accumulated censure, of the colonies, for measures to which a united Parliament, and the concurring powers of the Legislature, have deliberately given form, substance, and authority. This point was brought most distinctly and successfully to the notice of the House of Commons; and we have reason to hope that henceforth such complaints as needs must be got up, or such as heuceforth such complaints as needs must be got up, or such as have any actual foundation, will take just that direction, and light upon those shoulders to which the commonest principles of justice

ought to conduct them. We have said before, that we can scarcely believe a tenth part of the murmurs with which the air of Parliament is rife have any colonial origin, or can exhibit the honours of a colonial pedigree. Still, if we err in that opinion, we are confident we do not in this—that our mining friends, sprinkled not very sparingly up and down the most promising of the magnificient districts in question, will make a just discrimination between the supreme irresponsible powers of the Imperial Parliament, and the merely administrative duties of the Colonial Minister.

The letter of a correspondent, which will be found in another column, touching on the Cost-book System, and the accounts made up at the two-monthly meetings of adventurers, is deserving of attention beyond that of the mere note we have appended thereto, as, however strange it may appear, the very complaint made is calculated to elicit the like from other parties who, with good reason, have to complain of a different course being pursued. Instead of an extreme caution being observed in the instance before us on the part of the pursue to have many of the pursue. part of the purser to have moneys in hand to meet current outgo-ings, and taking good care to have a surplus in hand, it will be found in other cases which, unfortunately, are too numerous to indivi-dualise, the error, and, as we have reason to believe, too frequently wilful, is committed of excluding or omitting claims, and thus mis-leading the advanturers as to the real eterts of the recent state.

dualise, the error, and, as we have reason to believe, too frequently wilful, is committed of excluding or omitting claims, and thus misleading the adventurers as to the real state of the accounts, dividends being declared on the Hudsonian principle, while, in truth, calls should have been made.

The particular case to which our attention is directed is simple in itself, and to which we invite attention, so that those who adventure in mines may take a lesson. We have already observed, that it is too frequent merchants bills and liabilities are kept back, until perchance some hundreds, any, even thousands of pounds, may be owing; and yet shares change hands—the uninitiated, or those placing confidence and unsuspecting, purchasing shares, under the impression that all back costs are paid up to the last meeting. We may here refer to the case of RICKETTS and another v. BENNETT and another, reported in the MINING JOURNAL, June 12-19, 1847.* where dividends were declared and divided at the very time moneys were borrowed from the bankers to the amount of 3668/s, which were applied in payment thereof, and the expenses attendant on working the mine. This in itself is sufficiently illustrative of the importance to be attached to the due observance of the Cost-book System, which, we are sorry to say, but few comprehend, and of those few too many misrepresent and so mystify as to deceive the honest and well-intentioned adventurer. We must, however, needs confine ourselves to the letter of our correspondent, who complains, and as we think with much justice, and on fair grounds, that at the meeting lately held of the adventurers in Spearne Consols, a balance of 3351. 13s. 10d. only was shown in favour, whilst such should have been 4351. The difference, we admit, is comparatively insignificant, but the principle is the same, and it is on that we are induced to make any remark. The mine is divided into 128 shares, and our correspondent, dividing the number of shares into the surplus, naturally arrives at the conclusion that th

surplus, naturally arrives at the conclusion that the result will warrant dividend of 3l. per share, or 384l., and then leave a balance of 50l. in the purser's hands.

This may be all very correct; but we think the sum of 50l. is far too small to carry on the mine for the ensuing two months. There is an old saying, of "eating the ealf in the cow's belly," and, we think, our correspondent is rather disposed to do something of the sort; for although a 3l. dividend might be declared to-day, we would ask, would not a call have been required on the morrow, or how were the costs to have been met for the current two months' expenditure? There is, however, a remark which, we think, the purser would do well to note—that of charging materials for the months of January and February cost, which should cover over a space, or period, of six months. On the other hand, let us see what is the ordinary course pursued by pursers, and the errors fallen into.

A case presents itself to our notice at the moment, which may serve as an example, although we would hope that it does not apply to "One and All." A meeting of adventurers, having a purser in Cornwall, was held in London not many weeks since, when the cost-book and accounts were presented: a trifling error led to an inspection of the accounts; this was followed up by the appointment of a committee to investigate the same, the result of which was, that instead of there being a balance of some 200l. or 300l. against the adventurers, there was absolutely a sum of some such amount in their favour—the purser luving, in his multifarious duties, happened to make a mistake. We can only say, in conclusion, that advanturers will do well to watch their pursers closely; in this case the error is on the safe side, while we regret to say, it forms an exception to the general rule.

We had occasion, in a late Number, to advert to the anniversary dinner of the Iron, Hardware, and Metal Trades Prisson Society; and it is with pleasure we now direct attention to the notice, which appears in our columns of to-day, of the election of additional pensioners on the 28th inst., when we trust that the vote given for the successful candidates will afford conclusive evidence of the additional support rendered by the trade and those associated therewith. When it is considered the number of iron-

dence of the additional support rendered by the trade and those associated therewith. When it is considered the number of iron-works, forges, foundries, iron merchants, ironmongers, and those allied with the several branches, comprehended in the metal trades, with Mr. Ald. Trompson, M.P., as president, Sir J. J. Guest, With Mr. Ald. Trompson, M.P., W. T. Copeland, M.P., Messes. Kennard, Daniel, H. L. Taylor, Gould, Moser, Cottan, and others, as vice-presidents, we cannot doubt for a moment but that the objects of the promoters will be fully carried out; while to the credit of all parties associated with its management, from the collector, secretary, and even the solicitor, all offices held are honorary—the only object being the rivalry as to the advancement of the interests of the institution.

We cannot quit the subject without directing attention to a sermon preached by the Rev. Thomas Burner, D.D., F.R.S., of St. James's, Garlick Hythe, on the 22d April, in aid of the funds of the institution, which has been published, the profits being applied to the objects of the society. The learned gentleman took for his text II Chronicles, clap. 11, v. vii.—

Send me now, therefore, a man coming to work in gold, and in silver and in brass, and in iron, and in purple, and crimson, and blue, and that can skill to grave with the cunning men that are with me in Judah and in Jerusalem, whom David, and able discourse propounded, the reverend doctor observes—What a poor, uninteresting, and, as he might say, useless period of existence would the present life be without a knowledge of God, and the practice of those duties, virtues, and sympathies, which that knowledge teaches and inculcates! So in like manner, what a block, disconsolate, and discordant state would society exhibit without a knowledge of God, and the practice of those duties, virtues, and sympathies, which that knowledge teaches and inculcates! So in like manner, what a block, disconsolate, and discordant state would continually in against each other, and all pub

ite interests would coase to attract the care and concern of the community; then would return that disordered, confused, and dark state of things—Chaos. It is not our intention to follow the discourse, as our object is rather to invite attention to the sacred writings to which reference is made—"Solomon's Temple;" Jabal, the son of Lamson, with his brother Jubal, who invented the "hurp and the organ," with Tubal Cars, who was applied to as an "instructor of every artificer in brass and iron," being cited as illustrative of the position advanced by the reverend gentleman; and, with the following extract from the sermon now before as, we must close this pleasing office of inviting attention to the objects and the relief afforded by the society:—

"In charitable associations of this description there?" seemthing algority and interest.

"In charitatio associations of this description there's something pleasing and interest-ing; they remind us of that beautiful and instructive argument of the great Apoele of the Gentiles, in the twelfth chapter of his First Epistle to the Corinthans, where he de-scribes the symmetry and unity so conspicuous in the natural body, which, being con-structed and made perfect by the conjoining of many different members, yet possess a divine principle of kind affection, soldering fogether, as it were, the complete 'whole,' and diffusing through every part a glow of concord and good will—so that 'If one mem-ber suffer, all the members suffer with it; or one member be honoared, all this impul-bers rejoice with it;"

PROSPECTS OF MINING INDUSTRY.

In the observations offered in our Journal the week before last, regarding the hopes which the settlement of their affairs by the Hungarians hold out to our mining and manufacturing interests, we touched generally upon one or two objects, to illustrate the nature of the new demand which may

ont fo our mining and manufacturing interests, we touched generally upon one or two objects, to illustrate the nature of the new demand which may be expected: The rapid progress of the arms of the Hungarian Parliament; induces us to specify more particularly the markets which will shortly become accessible to our traders.

It has been observed, with regard to copper, that refined qualisies are those sought in Austria; for although Hungary abounds in copper ore, yet there is neither cheap fuel nor technical skill to refine cheaply. A critical correspondent, indeed, volunteered the presumption, that this assertion involved a slur upon the Austrian merchants, who come hither as to the cheapest market for refined metals, and export half-manufactured produce. Our remark was not intended to convey any slur of the kind, for experience has sufficiently shown, that in every country the interests of trade are safest in the merchants' hands; besides, it is to this very calculation of their knowing the advantage of buying cheaply, that we have to look for an extension of our trade on the present occasion.

The remark ventured applied to the Austrian Government, happily for the finest countries of Europe, now overthrown, and not likely to be able to enforce its antiquated financial notions on the rest of the world. The Government did not share the merchant's notion, that he ought to buy and sell-where he could do so best, and accordingly imposed the following duties upon refined metals insported, and on half-manufactured, when exported:—Refined copper, 2l. per ton; copper wares, 7sl.; iron bars, 12l.; iron wares, 24l.; lead, in sheets and pipes, 17l. per ton.

As we before stated, the Hungarians have, for many years, wished to throw off the intolerable yoke of these duties, which, far more than their inland position, cut them off from Europe and the civilised world at large. The Austrian Government made, indeed, a parade of appointing only men who had passed scientific examinations as directors of its mines; but the consumi

lf

The Austrian Government made, indeed, a parade of appointing only men who had passed scientific examinations as directors of its mines; but the consuming population, in Hungary at least, thought it would be more meritorious to allow foreign wares to enter, than to bolster up artificial manufactures by such enormous protecting duties. The whole production of the empire was ridiculously small for a population of 36,000,000. The official returns give it as follows:—Copper, 2457 tons; iron, 132,469 tons; lead, 5902 tons; and the prices at which the official valuations are laid show the cost of producing even this small supply. Prg-iron costs the Government miners 71; rolled, 221; sheet, 441, per ton.

The greater part of both the Austrian and Turkish empires being agricultural countries, their consumption is almost wholly of finished wares; hence they are valuable customers. The road by which access to the sea was easy for Hungary was, consequently, separated in the last century from that kingdom, and placed as the militury fromiter under martial law, under pretence of checking the incursions of the Turks. These incursions might have been more easily repressed than by military colonies, if the Austrians had properly kept up the trade with the Turks. Along the frontier of Hungary and Bavaria there are appointed stations, called "Rastellen," where it has long been the practice to hold fairs, and where the custom has been to purify cattle by driving them through the stream, which forms the boundary between the two countries. Unhappily, however, the trade between two agricultural countries could not be a large one. The Hungarians had no useful manufactures to give, nor were any to be got from the northern inhabitants of Turkey. Both possessed ahandance of wool, grain, cattle, hides, hemp, and timber, and no one wanted his neighbour's superfluity. Had the import trade from England been free, large quantities of saddlery, cutlery, arms, farming implements, tin and zinc plates, copper wares, sheet and pippe-lead, would ha intolerable when laid on after the Austrian demand. As a necessary consequence, these thousand cheap wares which our manufacturers in Warwickshire and Staffordshire produce of such excellent quality, were excluded from these vast and rich tracts. We take upon ourselves the full responsibility of recommending an adventure of an assorted cargo of saddlery, cutlery, and lead and copper wares, to be tried as soon as the Daily News (the bost informed source on Hungarian matters) shall announce that the Magyars have taken Fiume, for there will be an immediate demand, almost to any extent, for such articles, and the prohibitive duties will not only be immediately done away with, but there are regular facilities at Fiume on the Adriatic for bonding.

A. M. Cyprian Robert, who devoted of late years considerable time and research to the state of these countries, was able to detect the coming struggle for emancipation, and hit upon a truly French mode of insuring the influence of his country in the new field about to open. His eye was caught by the fine military position of the inhospitable Balkan, on which he constantly sees 20,000 Frenchmen parading the tricolour, and scuding down the inspiring tones of the Marseillaise to the many-coloured mass of nations on the plain.

When we visited the same parts, we planned a totally different kind of

stantly sees 20,000 Frenchmen parading the tricolour, and scuding down the inspiring tones of the Marseillaise to the many-coloured mass of nations on the plain.

When we visited the same parts, we planned a totally different kind of intervention. We fancied a few hundred smart commercial travellers transformed into supercargoes, carrying a formidable array of English manufactures down the navigable Save into the heart of Hungary, at its point of junction with Turkey, distributing the tools of industry and the means of economising time to the inhabitants of those rich countries, living at almost free quarters, until the time of sheep-shearing, rape threshing, and tobacco drying arrives, and coming back to a London winter with their vessels filled, at rates which must at least yield 100 per cent. on the capital of their employers. Such an expedition would do more to insure moderate duties and good treatment for our merchants, than all the diplomatic missions which for centuries have mystified and delayed what the instinct of human nature sees clearly and finds easy to accomplish.

The peculiar position of the Hungarian landowner, in being exempted from the evils of a land-tax, has already been pointed out in the Mining Journal. He is, consequently, only limited in the extent to which he can produce by his command of tools and his prospect of a market. Give him a market at the lowest conceivable price, and he will till the soil, not being exposed for so doing (like the German, the Frenchman, the Canadian, and the Bast Indian) to a fine for being industrious. Let him, therefore, have his meed of English ploughs, harrows, threshing machines, saddlery, shears, sickles, and he will pay well for them in wool, wheat, maize, hemp, flax, tallow, and, above all, in magnificent tobacco, which, if our duties are too hard upon it, finds a ready sale at Marseilles and Gibraltar. This unraxed position of the cultivator of the soil is a mine of wealth for the trader, as it insures production, and, consequently, stocks of exchan

manufactured goods. The course is, consequently, this, We begin with America when we wish to get grain; and as long as America takes wares in payment, Russia and Hungary must keep to American prices. But when America is overdone, and the orders for wares cease, so that bullion must go out, up goes the price, until it covers the high protecting duties of Austria and Russia. The starvation price (80s, to 100s.) begins when these countries are overdone, which, with their duties, soon takes place. From this hint, it will be easy to deduce the value of the 20,000,000 of consumers opened by a moderate tariff in Hungary to our manufacturing no less than to our consuming population, whose interests, whatever designing people may say to the contrary, always go hand in hand.

Sale of the London and Blackwall Railway Engines.—At the Auction Mart, on Wednesday, Mesers. Pullon and Son submitted to anction the engines which have been employed on the Blackwall Railway to work the rope, and disposed of in consequence of the alteration in the motive power on that line. The first lot consisted of a pair of engines at the Minories station, of 10-horse power each, but stated to be capable of greater power; they sold for 3300. Another pair of similar make, and at the same station, fetched 3300., and five boilers 299. The engines at Blackwall, of 75-horse power each, and stated to have cost 7000. per pair in construction, fetched for one pair 22001, and the second pair 22001, and the boilers 311. All the lots were understood to be sold, and produced in the whole 11,7100.

It is said that the engine manufactory of the North-Western Railway, at Crewe, turns out a new locomotive and tender every Monday morning.

MINING LAWS OF SPAIN-No. III.

CHAP. VL-OF THE MINES BELONGING TO THE STATE.

ART. 32.—The following mines are reserved by the State:—the quick-silver mines of Almaden; the copper mines of Riotinto; the lead mines of ares and Falset; the calamine mines of San Juan de Alcaraz, in which the State only has the direct dominion; the sulphur mines of Hellin and Benamaurel; those of graphite or plumbago, comprised in the judicial department of Marbella; the iron mines, which in Asturias and Navarre are appointed to furnish the necessary mineral to the national manufactories of arms and ammunition of Turbia, Oroniceta, and Engui; the coal mines existing in Asturias, in the districts of Morein and Riosa, registered by the director of the manufactory of Trubia, for the supply of fuel to the same. The extent of the pertenencias of the aforesaid mines shall remain as at present; those which may not have been expressly determined, shall be settled by the Government. No person shall be allowed to open pits, nor make researches within the circuit or demarcation of the mines of the State unless by order, and for account of the Government; neither shall grants be made of pertenencias of mines, nor of slag heaps. Minerals which it may not be the object of the Government to work are excepted; for such the pits are to be made at a distance of at last 600 varas from the workings and works of the State. The slags from the mines or factories of the State belong to the same, and shall not be reduced by individuals, although they may be beyond the limits of the mine, or the jurisdiction of the factory. The State shall not in future be allowed to engage in, nor to acquire, mines or slag heaps, unless the Government be authorised by a special law. the State only has the direct dominion; the sulphur mines of Hellin and

CHAP. VII.—OF THE TRIBUNALS WHO ARE TO TAKE COGNIZANCE OF MINING MATTERS.

Chap. VII.—OF THE TRIBUNALS WHO ARE TO TAKE COGNIZANCE OF MINING MATTERS.

ART. 33.—The provincial councils shall take cognizance, with appeal to the Crown:—1. Of the oppositions to denouncements of mines and slag heaps, and of reduction works that may have been abandoned, or have forfeited their grants, according to the provisions of Articles 24 and 31.—2. Of the business relating to mines, in which the State has a direct and immediate interest, and in such questions as may arise between the administration and the miners. For the examination and decision of these matters the best qualified mining engineer of the province shall assist as special adviser, and have a vote.

Art. 34. The Royal Council shall take cognizance in opposition (en via contenciosa):—1. Of the appeals which may be made against the grants of mines, pertenencias, &c., belonging to the Government.—2. Of such as may arise through resistance to the conditions which the Government might impose upon the grants.—3. Of such as might be established by the resolutions of the Ministry against those who put forward the said remedy.

Art. 35.—The ordinary tribunals shall take cognizance of all disputes between individuals, and of the crimes and defalcations committed in the mining dependencies.

mining dependencies.

Art. 36.—Of the causes which arise through fraud in the mineral prothe competent tribunals shall take cognizance of frauds against the

public revenue.

ART. 37.—The tribunals shall not have the power in any case, except that of bankruptcy, to decree the suspension of the works of the mines or reduction establishment, nor to grant executions against the first, nor the effects necessary for its avia, but they may be granted against the produce, whether in bullion or specie,

CHAP. VIII.-OF THE CORPS OF MINING ENGINEERS AND THEIR SCHOOLS

Cast. VIII.—OF THE CORPS OF MINING ENGINEERS AND THEIR SURJOULD.

ART. 38.—There shall be a corps of mining engineers charged with the direction of the workings of the mines of the State, and of the other obligations relating to mining, and which the regulations may determine.

ART. 39.—There shall be a school of mines for the instruction of the students in the corps of mining engineers. There shall also be practical schools in Almaden and in Asturias for engineers, masters and captains of mines.

TEMPORARY PROVISIONS.

1. Grants which have already been made shall remain as up to this time; nevertheless, if the grantees wish is, the dimensions of their perturnencies may be enlarged to the 300 varus in length by 200 in breadth, measured horizontally, as fixed by the 11th article of this law, provided always that there is free space for it in one or the other sense. The grantees shall continue in the enjoyment of all rights which they may have acquired, with respect to the laws and regulations hitherto in force.

2. The same is understood with respect to the mines of iton which may

The same is understood with respect to the mines of iron which may be for the common benefit, which shall not be denounceable, except in case of not being able to continue the working in any other manner than by of not being able to con underground operations.

underground operations.

3. After the promulgation of this law, there shall not be established works of reduction by means of high furnaces in which wood fuel is employed, nor Catalan furnaces, unless the Government gives its authority, after a report from the chief magistrates, who shall hear the authorities of the towns where they may have to make the charcoal, and the commissaries of the woods of the district.

4. The success readily before.

saries of the woods of the district.

4. The causes pending before the inspectors and the superior tribanal, or direction of mines, whose especial jurisdiction is suppressed by this law, shall be transferred, according to their state and nature, to the competent tribunals, with reference to this same law.

5. The Government shall publish, as soon as possible, the regulations necessary for the execution and explanation of this law, whose provisions shall, meanwhile, remain in superise.

necessary for the execution and explanation of this law, whose provisions shall, meanwhile, remain in suspense.

6. Lastly, an especial and protective law shall fix the duties upon mines and their products; and, in the interim, they shall continue as at present, We, therefore, command all tribunals, justices, magistrates, governors, and other authorities, civil, military, and ecclesiastical, of whatever class and dignity, that they protect, and cause to be protected, fulfilled and executed, the present law in all its parts.

Given in our palace the 11th April, 1849, I, the Queen. The Minister of Commerce, Instruction, and Public Works, Juan Brayo Murillo.

COPPER MINING AND SMELTING IN NORWAY .- According to the report of Mr. Sinding, Bergmester, in Norway, delivered to the Norwegian Government, and published by them last month, it appears that, in the year 1847, the total number of miners employed in the Norwegian copper works were 694; the quantity of ore produced 9899 tons; total expenditure of the mines, \$55,324. During the same period, the quantity of ore melted at the different smelting establishments (eight in number) was 10,536 tons; the quantity of copper produced 546 tons; in the production 17,228 lasts of charcoal, 795 fathoms of wood, and 3065 tons of coals were consumed) the total smelting charges were \$56,431. Of this quantity the Alten Mines smelted 22255 tons, which gave 124 tons 1 cwt. 1 qr. fine copper; 274 fathoms of wood and 3065 tons of coals were consumed; the smelting charges were \$13,426. The highest smelting charges are those of Roraas, which are \$107 30 skillings per 100 barrels of ore, each containing 750 lbs.; that of Alten is \$93 25 sk, for the same quantity; the lowest are those of Eidet, which are \$66 10 sk, per 100 barrels. All these establishments, with the exception of the Alten, employ blast furnaces, the operations there are conducted on the Swansea method. The average per centage of the ore produced from the different mines is as follows:—Alten, 55 per cent.; Quaenangen, 784; Roraas, 306; Scelbo, 406; Meraker, 405; Tranfield, Ytteroen, 14-4. Sixty workmen during the same period were employed on the different lodes of chromate of iron; 510 tons of this were obtained at the number of miners employed in the Norwegian copper works were 694; the field, Ytteroen, 14-4. Sixty workmen during the same period were employed on the different lodes of chromate of iron; 510 tons of this were obtained at the cost of \$5977. The establishment for the manufactory of chromate of potash had reduced 455\(\frac{1}{2}\) tons of chromate of iron, and had used in its reduction 13,428 barrels of coals=1380 tons; 163,076 lbs. Russian; 93,267 lbs. Norwegian; and 921 lbs. American potash. The total expenditure of the manufactory was \$35,494 110 sk.; while the produce was 308,890 lbs. chromate of potash, valued at \$41,000 — making a profit on the year of \$5505. The total production of the whole of the district was valued at \$252,250! In the same year, setts (multings) were taken for 15 copper mines, 4 chrome, and 1 lead. But few of the copper mines were paying any dividends, the generality merely supporting themselves. With the exception of the works at Omdal, in Tellemakon, the property of Messrs. Reid, Irving, and \$600, and Sociersala, near Christiansand, which are now abandoned, all the copper mines of Norway lay in the northern district, so that we have here given the total production of copper as well as that of chromate of iron. The report of the silver mines at Kongsberg and the different iron mines had not been delivered into the Government.

CHESTER AND HOLYHEAD RAILWAY.—The only remaining link in the completion of this line will not now very long be wanting. Mr. Stephenson, the engineer, in conjunction with Captain Claxton, R.N., and Mr. Edwin Clarke, has, after a series of preliminary experiments, decided on the plan for launching, at an early day, the tubes that are destined to span the Menai Straits and form the Britannia Bridge, through which the trains will make their transit, and thereby supersede the necessity of taking passengers over that pertion of the line, at a considerable delay, by ordinary vehicles. The pontoons for the launch are already on the and.

ON PYROGEN. - No. V.

BY JOHN JOSEPH LAKE, ROYAL LABORATORY, GOSPORT.

In this paper I propose to call the reader's attention to what appears to be one of the peculiar and important offices of pyrogen. Water, we are aware, is a medium by which many chemical substances amalg are decomposed, and new forms of matter produced. Every device may be adopted to effect a chemical change between some substances in vain; but let only a little water be introduced, and the desired effect is instantly brought about, and new forms of matter, possessing totally different properties, arise. Pyrogen acts in a similar way; and, by its abstraction or introduction, chemical action takes place. Thus nitric acid is produced by electric discharges in atmospheric air; also, when mercury is placed in contact with a solution of ammonia, and brought under the influence of a strong current of pyrogen, the moreury expands in volume, and becomes a soft substance. When communication with the battery is broken, the natural state of the pyrogen and other matters is restored, the affinity between the mercury and ammonia destroyed, and the amalgam resolves itself, into its original elements. Potassium, sodium, and other metals of the same class, are instances of the operation of this cause, the affinity between the metals and the oxygen being destroyed by electricity. This was first effected by powerful galvanic batteries, the other and more recent way being the employment of intense heat. By the latter method, a similar operation takes place as with a battery, the heat disturbing the natural electric state of the metallic oxide, and it may, therefore, be termed the thermo-electric method. are decomposed, and new forms of matter produced. Every device may

natural electric state of the metallic oxide, and it may, therefore, be termed the thermo-electric method.

Pyrogen appears also to be an essential ingredient, or agent, in the composition of carbonic acid, which is readily generated by passing a current through carbon points in presence of oxygen; also by the thermo-electric method of burning; for what I have already observed, concerning a candle being the electric light, applies to any-substances in a state of ignition, or combustion. Flame, as already shown, is produced in the union of oxygen and hydrogen, which form, as it were, the electrodes of Nature's galvanic battery, pyrogen being developed as in the artificial battery, when the electrodes are brought sufficiently near together and in a proper state. The red colour and light of a charcoal, or coke, fire arises from a similar cause, the difference being that carbon takes the place of hydrogen. The products of combustion, carbonic acid and oxide, prove the correctness of my views to a very considerable extent.

The well-known experiments on the ignition of metals in acid solutions, by Prof. Grove, Mr. Pollock, and others—some of which I have already illustrated—appear to show the correctness of the above. When small wire electrodes of platinum are employed, and dipped in water, acidulated with sulphuric acid, the acid is decomposed—the sulphur combining with the metal of the negative wire; thus pyrogen acts in this case in a manner similar to a quantity of water poured into a mixture of tartaric acid and carbonate of soda. The decomposition of the acid cannot be the result of the affinity between the platina and sulphur, as Prof. Grove has very justly concluded; for, on performing the experiments with nirric and muriatic acids, the results are similar—the acids being decomposed, although there exists a very weak affinity between platinum and lived of nitrie acid.

nitric and muriatic acids, the results are similar—the acids being decomposed, although there exists a very weak affinity between platinum and hydrogen, and the other gases disengaged. In the instance of nitric acid, we find that it is both formed and decomposed by the agency of pyrogen. Many will, no doubt, differ with me as to the correctness of my views of this subject; and their great importance will naturally create difficulty in the way of their correctness being admitted. Nevertheless, I feel assured that the principles, if not all the details, will stand the test of time and investigation; for they are founded upon experiment and long observation. The materiality of the electric fluid being once admitted into the mind, its offices may, perhaps, meet with less oppositior.

IMPROVEMENTS IN STEAM ENGINES AND FURNACES.

IMPROVEMENTS IN STEAM ENGINES AND FURNACES, [Specification of patent granted to Mr. James Burrowa, of Haigh, near Wigan, engineer and draughtsman, and George Holeroft, of Manchester, consulting engineer, for cortain improvements in and applicable to steam-engines, in the machinery and apparatus belonging thereto, in the construction and arrangement of boilers for the generation of steam, and in the furnaces and fluee connuceded therewith, parts of which improvements are also applicable, to attact sheating represence.] **Advances** *

ensitutes a fourth claim.

The last improvement and claim specified consists in having the cylinder of a steamngine fitted with three pistons, of which the top and bottom ones are connected together,
and only move through a portion of the stroke; their office being to act as valves and
oints of resistance to back pressure of steam employed to give motion to contral piston.

Mode of Silvering Glass by the Employment of Gun-Cotton.—
M. Vohl has recently discovered that a solution of gun-cotton, in a caustic ley, possesses, in a high degree, the property of precipitating silver from its solutions in the metallic form. In fact, on bringing gun-cotton into contact with a caustic ley, of sufficient strength, the cotton will become dissolved in the ley, giving out ammonia with a considerable degree of heat, and producing a deep-brown liquor, somewhat thick: on pouring an acid into this, a brisk effervescense is produced, carbonic acid and nitrous acid being disengaged. The action of the gun-cotton, in this instance, shews that it is not simply dissolved, but undergoes decomposition, by which the atoms of oxygem in the nitric acid enter into combination with the atoms of carbon in the cotton, thus producing carbonic acid, which, as well as the nitrous acid produced by the nitric acid, combines with one part of potash. A fresh decomposition of nitrous salt by the potash, in presence of hydrogenated substances, furnishes ammonia. The most remarkable property of this alkaline solution is the following.—On pouring into it a few drops of a solution of nitrate of silver, and adding ammonia until the oxide of silver formed is re-dissolved (the mixture being slowly heated in a water bath), the liquor will, at a certain period, assume a deep brown colour, and effervesce, the whole of the silver being precipitated on the sides of the vessel. The merror thus produced is much superior in brilliancy to those produced by means of etherial oils or ammoniacal addehyde; and the faccility with vesse. The interior thus produced is much superior in brilliancy to those produced by means of etherial oils or ammoniacal aldehyde; and the facility with which it is produced will doubtless render it of practical importance. This property is not exclusively possessed by gun-cotton; it is found also in cane sugar, sugar of milk, manna, gums, and other substances which may be rendered explosive by treating them with nitric acid. Picro-azotic acid produces, under the same circumstances, a reflective metallic surface; and it appears that this posive by treating them with hitric acid. Picro-azotic acid produces, under the same circumstances, a reflective metallic surface; and it appears that this reaction takes place with all bodies which, when treated with hitric acid, do not furnish products of oxidation, but another series of bodies which admit of carbonic acid forming one of their constituent parts, since they at the same time give up an equivalent of water.—Technologiste.

The Stevenston Coal Company, who have been lately sinking a new coal-pit to the south-west of the town, and immediately adjoining thereto, found, on Saturday week, the seam they were sinking for—viz.: the main coal, being upwards of 4 ft. thick, about 58 fms. down, of excellent quality, and of the same description as they so long successfully wronget in several of their other pits. They are about sinking for the turf dyke coal in another part of their mineral fields.—Glasgow Chizes.

New LOCOMOTIVE FOR BURNING HARD COAL.—The locomotive ordered by the Fitchburg Company some time ago, adapted to hard coal as fuel, has been completed by Hinckley and Drury. It is named the Anthrocite, and is found to work well so far. It is a freight engine, and went up the road with a heavy train on Saturday morning.—Bunker Hill Agrora.

SHREWSBURY AND BIRMINGHAM.—The first section of this line for ury to Oakengates is complete, and nearly ready for opening. T nent inspector is to go over it in a day or two.

Original Correspondence. ALWAYS AND MINES.—No. I.

Sin. Your this correspondent, "Placer," seems to consider railways as an argonized to brief and that the depression of the one will promote the property of the other. Because railway shares are now at a discount, and sorting fevelations in relation to their management have recently the track, he recommends capitalists to withdraw their investments from them, and purchase mining shares; or, if a "safe medium of investing large masses of spare capital" be required, he "does not hesitate to express a decided opinion" adverse to railways and in favour of mines. The subject is an important as well as an interesting one; and although you have expressed your concurrence with these opinions in your editorial remarks, yot the encouragement you have ever given to a free discussion of the subjects of your "Original Correspondence," is a sufficient guarantee that a diversity of views does not constitute any reason for their exclusion from your columns.

discussion of the subjects of your "Original Correspondence," is a suncient guarantee that a diversity of views does not constitute any reason for their exclusion from your columns.

There are few interests which have been more benefitted by the establishment of railways, or whose full development is more dependent on their extension, than that of mines; it was among the collieries that railways originated, and they were nurtured and improved by the strong necessity which impelled the cheap production of coal. The first public railway (the Stockton and Darlington) was instituted to convey minerals to the shipping ports; nor was passenger traffic a primary object with the projectors of the Liverpool and Manchester, the Canterbury and Whitstable, and other railways, of about the year 1830. The conveyance of coal, iron, lead, and other mineral produce, as well as the carriage of general merchandise, were then the principal sources of anticipated revenue. It was not until after the opening of the Liverpool and Manchester, that passengers became an unexpected principal source of railway traffic. This brief retrospect shows the intimate connection there is between railways and mines, and that the prosperity of the one must tend rather to promote than militate against the interests of the other. Railways, it is true, have of late years been extensively patronised by the capitalist, and immense sums have been invested in them, with, perhaps, too much precipitancy, and on somewhat too speculative grounds. But the most "untoward event" in their history is the unfortunate mania of 1845 and 1846, from the depressing effects of which they have not yet recovered. Misfortunes of this kind are not, however, peculiar to, or confined to, railways only—other adventures and speculations have suffered from similar visitations. Somewhere about 25 years ago there was a mining main, as rabid and almost as diasstrous as the recent disease in railways; joint-stock banks, and the iron, tallow, tea, cotton, leather, wool, corn, and other almost as disastrous as the recent disease in railways; joint-stock banks, and the iron, tallow, tea, cotton, leather, wool, corn, and other trades have all passed through trials of the same kind. In all these instances speculation ran riof for awhile, irrespective of all reasonable control—some few rapidly made, and many more as quickly lost, large fortunes; then the bubble burst, and there came stagnation and depression, as in the instance now before us

rapidly made, and many more as quickly lost, large fortunes; then the bubble burst, and there came stagnation and depression, as in the instance now before us.

It is evident, therefore, that this commercial malady is neither exclusive in its attacks nor permanent in its consequences, for the interests which have been periled by it are many and dissimilar, and have long ago recovered from its effects; and there is no reason why railways should not also revert to their original state on the gradual subsidence of the exciting causes of its depression; but it may probably be said, and with truth, that the recent disclosures as to the management of some lines, will very materially retard the re-establishment of public confidence in railways as an investment of capital. Deplorable as these revelations of gross malversation undoubtedly are, yet it is but reasonable to anticipate that some important and lasting benefits will result from them. An opportunity has thereby been given to effect a complete revolution in the system of management hitherto pursued, and the shareholders will have themselves to blame if they permit the administration to relapse into its past state. However indefensible the conduct of Mr. Hudson may have been, the servile submission of his colleagues is equally reprehensible. They were chosen by the shareholders to protect their interests and guard their property, and were individually responsible for the due discharge of the important duties entrusted to them. The manner in which they have acquitted themselves of these obligations, voluntarily undertaken, is too notorious to require description. Were the deputy-chairmen, and the other members of the boards, not gentlemen of known probity and honour in private life, there would be little difficulty in characterising their conduct; but, under these circumstances, we are obliged to conclude, that their vigilance has been set to sleep, their judgments warped, and the reproofs of conscience silenced, by the irresistible fascination that hovered aroun

"In his living Walked crowns and crownets; realms and islands Were as plates dropt from his pocket." Having thus bent the knee to the iron crown, and basked in the smiles of the monarch, it surely is not too much to expect them to follow him into his exile, and to resign a trust which they held only to minister to his power and greatness. By such a course they would best serve the interests of the proprietors, and make the only amends in their power to the constituents whose confidence they have disappointed. Should they still cling to office, in the delusive hope that Mr. Hudson's retirement will be accepted by the public as a scape-goat for their transgressions, there will not be wanting, it is to be hoped, some Oliver Cromwell to turn them out of doors, and put the key in his pocket, keeping it safe until it is required to open the door for the admission of better men. It may probably be said that such a sudden dismissal of experienced directors, and the substitution of untried men in their place, would be attended with evil results. Some inconvenience might possibly ensue; but, with an office establishment and working staff accustomed to the several duties required to be performed, the new directors would be speedily qualified to act well and efficiently; and less detriment would arise from such a course of procedure than by retaining in office any members of the Hudsonian boards. Should such a course be pursued, there are better times yet in store for railways, and much lasting good may ultimately result from the evils which have befallen them.

Without therefore depreciating the value of mines as a good means of Having thus bent the knee to the iron crown, and basked in the smile

Without, therefore, depreciating the value of mines as a good means of investing capital, too much stress ought not to be laid on any depression in railways which arises from temporary or remedial causes; nor is it fair to take the difference in the prices of shares at different dates, and state the amount of such difference as a loss actually sustained. An Engineer. [To be Continued.]

GOOD CONDENSING WATER FOR STEAM-ENGINES. Sig.—I am not a little surprised at the statements made by Mr. Sims, of Redruth, of the ill effects of condensing water on the steam-engine in Cornwall, when so simple a remedy may be had. What Mr. Sims proposes is a remedy; but I think there is one more simple and less expensive, and without any alteration to the present condensing work, or even without pumping the water from the adit. Now, if you take the hot water from the results of the property of the property of the present condensing work, or even without pumping the water from the adit. without pumping the water from the adit. Now, if you take the hot water from the air-pump and cause it to pass through the cold water in a series of pipes (copper is the best, because they can be made thinner than of any other metal), this same water will return for condensing with a gain ad infinitus; all that is required is, a sufficient quantity of pure water to fill every part with at first, and a small supply to make good the loss. The present condensing water will do, if purer cannot be had conveniently. If the water lifted from the adit to surface be not required for dressing, &c., this "cooling" process may be carried on at the adit level, and thereby save the lifting of that quantity of water to the surface; or, perhaps, a less quantity may do. The hot water will have to run down to the adit, pass through the series of pipes immersed in the cold water, and return to condense with again at the surface. If there is a sufficient supply of water to condense with on the surface, all that is required is a sufficient quantity of small copper or other pipes, about 1½ in. diameter, and wood launders to place the pipes into, to allow the cold water to circulate outside at the same time the hot water is circulating inside: the process is complete. I will supply drawings and estimates of the expense to any party who will give me a description of the situation, size of engine, &c., &c., and an analysis of the water where such a plan is proposed to be adopted.

Parys Mine, May 7.

IMPORTANCE OF GOOD WATER FOR STEAM-BOILERS.

IMPORTANCE OF GOOD WATER FOR STEAM-BOILERS.

Sin,—I have just read, in your last week's Journal, a communication headed as above, and am glad to see that important subject claiming some attention amongst practical men. Mr. Sims has well described some of the serious defects of the present system of supplying water as it is pumped from the mine, charged with various earthy matters, in some cases almost to saturation, and even where the water is tolerably clear, it contains in some districts pernicious compounds held in chemical solution, and which become too manifest in the boilers, condensers, air-pumps, and feed-

pumps through which it passes. Mr. Sims proposes, as a remedy, the adoption of Hall's condensers, so as to secure a supply of pure water to the boilers; this object can, I believe, be obtained by a much more efficient and less costly means—vix. Howard's patent condenser. In the latter simple and satisfactory process, the water admitted through the injection cock for condensation, is extracted by the air-pump, and delivered into the hot well in the usual way; but from the hot well it is passed through a series of small tubes, these tubes being placed within a cistern, through which a good supply of cold water is flowing, and the same injection water, with the products of condensation, after having passed through this refrigerator, is conducted back to a cistern, and again used as injection water, and so on ad infinitum.* Now, it is evident that if this water be pure to begin with, and the boilers are also filled right height with pure water, no deposit can result; and as the apparatus is provided with a vapouriser for the supply of any loss occurring through leakages, &c., the engine may work for years with clean boilers and water-courses. In Hall's plan there is a pressure, varying with the degree of vacuum obtained, upon all the tubes composing the condenser, and also the packing joints and serews which secure the tubes into their places; many hundreds of these joints, with all their liability to leakage, and which leakage would directly interfere with their utility, being necessary in a large engine; while in Howard's mode these liabilities to derangement can scarcely be said to exist, and its easy adaptation to engines already at work, is too obvious to require further exclanation.—J. Stenson: Northampton, May 7. adaptation to engines already at work, is too obvious to require further explanation.—J. Stenson: Northampton, May 7.

IMPROVEMENTS IN TUBES FOR LOCOMOTIVES AND MARINE ENGINE-BOILERS.

Sir,—I was rather surprised at the contents of a paragraph in your las aper, relative to a patent obtained by Messrs. Richardson and Co., of Dar-aston, Staffordshire, under the above head. The mode of operation therein laston, Staffordshire, under the above head. The mode of operation therein alluded to has been in common practice for several years past, and from the general account given there would appear to be nothing new in what Messrs. Richardson and Co. claim as the subject of their patent. I know works where the rolling of copper and brass on a mandril, through a pair of grooved rollers, in the manner stated in your paragraph, has been regularly carried on for a lengthened period, and where, therefore, the movelty of the present invention consists I am at a loss to discover. A patent for the mannfacture of rolled copper and brass tubes without joints is now in existence, and is one by which the most perfect tubes can be produced. "The native ingenuity of our country" has thus, you will perceive, not been slumbering, or waiting for the present discovery. Onserver.

COPPER SHEATHING

COPPER SHEATHING.

Sin,—Mr. Prideaux does not comply with my request in communicating the information required, because precipitation by iron is a foreign process to us. Under the circumstances, I could not think of giving him the promised information. Mr. Prideaux should not be over delicate in communicating any information he may have derived from his friends, or otherwise, as he must perceive that I have almost let the cat out of the bag in order to arrive at the truth of this mystery. Perhaps Mr. Prideaux is not aware that our object is, and has been, to get all the metal we can out of the ores, and as soon as possible, so as to swell the surplus, without any regard whatever as to the durability of the copper. I have no doubt that, when Mr. Prideaux clearly sees our position, he will conclude that it is not an easy thing to turn us out of our ordinary way of doing. I shall be always anxious to keep this discussion alive.—A Roaster-Man, May 9.

RECENT EXTINCTION OF THE COLLIERY CONFLAGRATION

RECENT EXTINCTION OF THE COLLIERY CONFLAGRATION. Str.,—I was extremely delighted with Mr. Goldsworthy Gurney's ingenious and truly scientific application of a jet of high-pressure steam to the ventilation of coal mines; but I have been electrified at the triumphant success which has attended his recent process of the extinction of a fire in the recesses of the coal mine. I admire it for its novelty; I applaud it for its scientific ingenuity. It shows the value of science, and attests the triumph of mind. When I was examined, along with my former colleague and friend, before the Commons' committee, I confess I was startled by the held idea of his proposition of illuminating the mine by light reflected from mirrors; but I frankly avow this transcends even that gigantic scheme. To overwhelm combustion, under such circumstances, by an inundation of invisible gases, is certainly at once startling and astonishing!—J. Murray: Portland-place, Hull, May 8.

DECOMPOSITION OF LIGHT BY REFLECTION.

DECOMPOSITION OF LIGHT BY REFLECTION.

Sir,—Last year I published an experiment anonymously, showing that the retina of the eye possesses the faculty of decomposing light (Athenæum, No. 1080; Year Book of Facts, 1849, p. 140). It would appear from the following experiment, which, as far as I am aware, is new, that it also undergoes decomposition by reflection. On closing one eye, and holding up any solid body, so as to screen the light passing in at a window from the open eye, except a very narrow strip between the window frame and the edge of the screen, the whole of the colours of the solar spectrum will be rendered visible—the violet appearing on the window-frame, the red at the screen, and the other colours in their proper order between. On placing a second screen nearer the eye than the first, and admitting a strip of light between their edges, the same effect will be observed; but in this instance the violet appears at the first screen instead of the red, and the red at the second screen nearest the eye. An uniform law will be observed in this—viz.: that the red end of the spectrum always occurs at the nearest screen. When the two screens are placed at equal distances from the eye, red appears at the edge of each, and a deep blue line equidistant between them. When the edges of the screens are of polished metal, there is no difference in the result. The following appears to be the proper explanation of the cause of these appearances:—The screen nearest the eye effects the decomposition of the light; the red rays are developed on its edge, the blue rays on the edge of the furthest screen, and the violet on the body of the screen itself. The use of the remote screen appears to be to keep back the glare of the direct white light, and so render the decomposition of the rays in contact with the nearest screen visible, which, without this, could not be observed. In the sketch, R represents the rays seen between the screens, S S and T, the rays, R, undergoing decomposition, which is accomplished by reflection, a

It is remarkable that the degree of reflexibility of the coloured rays is in the same order as that of their refrangibility. Red suffers the least, if it be not in reality developed by the other rays deserting it; it appears on the edge of the nearest screen. Violet suffers the greatest amount of reflection, appearing on the body of the furthest screen, as indicated by the dotted line in the sketch; the light of a candle, or lamp, or of the moon, undergoes decomposition in the same way. On looking at the moon through a small pin-hole in a card, it appears reduced in size, and if the edge of the hole in the card be brought so as to conceal about half the surface of the moon, the prismatic colours will be rendered visible, red appearing at the edge of the hole, the other end of the spectrum at the edge of the moon, and the intermediate colours in their proper order between. If the light of a candle, lamp, or the moon, be reflected from a polished white metal rod, or roll of tin, it may be decomposed by bringing the edge of a screen to it. In this instance the rod answers for the screen furthest from the eye, and the reflection for the light admitted from the window.—John J. Lake: Royal Laboratory, Gosport, May 9.

STEAM NAVIGATION-MARINE LOCOMOTIVE.

RESPECTED FRIEND,—I believe it is generally admitted among scientific men, that steam navigation has not answered the expectations which had been entertained respecting it—I mean in an economical point of view—the expense attending that mode of locomotion being very great, considering the limited speed hitherto attained. I have long thought that this might be attributed to the form of the vessel, which may be termed an elegacity-shaped raft, with a water-wheel whirling on each side; and may it not be asked whether there is not room for improvement on that principle. The sphere rolling on the plane has been long considered the true form of locomotion on land, but has never been adopted on the water, the raft, or sledge-formed vessel, being retained; but could not the former plan be adopted at sea with great advantage? I mean by suspending the vessel above the water on large hollow metal globes, or, rather, on their axles; the propelling power being applied to the globes, causing them to turn on

• In Howard's arrangement the boiler is supplied by a pump from the hot well in the need way, the remainder only being cooled down again for re-injection.

their axis. I presume that much less power would be required to make them revolve, than to put a vessel in motion by causing the paddles to beat the water on each side. Of course, strength and lightness should be combined in such a structure, in order to allow the globes to sustain the weight of the engines, &c., without being immersed more than one-sixth of their diameter. I introduced the subject last night to the members of the Liverpool Polytechnic Society, when an engineer present expressed his opinion that the propelling power required on either plan would be the same; but I believe I am not in error in imagining that there will be more than one opinion on the subject. Steam navigation is still evidently in its infancy. The power of steam has not yet annihilated space by sea as by land, and we may conclude that there is still room for improvement. I imagine that the adoption of the floating wheel might cause some change in the system; we would then have, instead of a steam-vessel, a marine locomotive, which would roll over the water instead of cutting through it. At the meeting alluded to, another member asked whether the revolution of the wheels would propel the vessel without paddles? on which the president remarked, that this was the question which was asked when the railway locomotive was first constructed, as it was thought that cogs would be required; but, of course, this is a mere matter of detail, as small fans might be placed round the globes, which would give them sufficient hold of the water. I think some plan based on this principle might be adopted with advantage, particularly in rivers with a strong current; and if the principle here proposed is sound, it is, I presume, susceptible of numerous modifications, or it may prove a stepping-stone to some plan which might cause some revolution in the mode of steam navigation.

Liverpool, 5th mo. 8.

JOHN DE LA HAYE. JOHN DE LA HAYE. Liverpool, 5th mo. 8.

ELECTRO-MAGNETISM AS A MOTIVE-POWER.

ELECTRO-MAGNETISM AS A MOTIVE-POWER.

SIR,—In the report of a committee, appointed by the Legislature of the United. States to inquire into the practicability of electro-magnetism as a motive-power, and which is inserted in your last Number, it is stated that the power was exhibited (among other ways) in the suspension of a mass of iron of 50 lbs, without visible support. As this statement has been made as a proof of the attractive power of magnets at a distance, I beg to observe that the attraction of one of the stationary magnets in my large electromagnetic engine, having 11 inches in a square, and only coiled with ten layers of riband wires, has been found to be—

The magnets being excited with 40 Maynooth cells, 6 inches square. Windsor-terrace, Pimlico, May 10. S. Нъокти.

WONDERS IN LOCOMOTION-NEW MOTIVE-POWER.

WONDERS IN LOCOMOTION—NEW MOTIVE-POWER.

SIR,—A correspondent of yours, who, masked by an assumed name of "Azotus," published in your valuable Journal of the 5th inst. a heap of abuse, mixed up with subteringes, on the subject of the pyroxyline power, is unworthy of being noticed; for every intelligent reader of your Journal will have seen that I am not answerable for the ignorance in which the whole world—and my tutor as a member of that world—was buried previous to the brilliant discoveries of Sir Humphry Davy on the subject of combustion. It was neither mine, nor my tutor's fault, that the Theoria Chemia Dogmatica of Stahl, supported by Becker, and not properly cleared up by either Cavendish, Scheele, Priestly, or Lavoisier, should have been so much in vogue at the time when my tutor had imbibed his first notions about the supporters and non-supporters of combustion. But as "Azotus" has now the advantage of seeing the true principles discussed, almost in every penny publication of the day, he might have had the charity of allowing me too as likely a chance of knowing something about the nature of carbon as himself. If my tutor erred on many points of science (as I have myself shown in the letter "Azotus" alluded to), still his theory on the explosive forces is good. But, what is better than all—my tutor was a GENTLEMAN.

Now transports of the day in the Mining Journal of the supplies of the complete and the mining Journal of the day in the letter "Azotus" alluded to), still his theory on the explosive forces is good. But, what is better than all—my tutor was

a GENTLEMAN.

Now, turning to another anonymous correspondent, in the Mining Journal of the same date, signing himself "E. M. L.," I will reply to him only by citing here a known fact—that the glorious uncertainty of chemistry may be compared only to the glorious uncertainty of the law. And the best proof of this assertion will be afforded by transcribing here a few of the analyses of the very pyroxyline which has caused this discussion:—

1. Messrs. Schmidt and Hecker ("E. M. L.'s" authority):—

By waight.

By volume.

2. Messrs. Porrett and Teschemacher*:—The formula in question as follows—C.12, H.s, O.s, +4 NO. 5 = nitrated ligning or in centessing

Carbon	20.00
Oxygen	62-22
Hydrogen	2.33
Nitrogen	15.56 = 100.00
Or it may be thus described :- Lignine dried at 3500-Carbo	n 20
Water	20=40
Nitrie acid (15.56 nitrogen, 44.44 oxygen)	60=100

3. Mr. Wm. Crumm:-Pure gun-cotton consists of-

24·24 = 21·21 = 54·55 =	7 HO.		24·24 = 12 C. 3·36 = 7 H. 14·14 = 3 N.
100-00)r	59.26 = 22 0.

5. Mr. Ransome's formula:—C.13, H.³, O.³⁰, N.³ From these results it would appear that gun-cotton is formed from ordinary cotton by the abstraction of 2 atoms of hydrogen and the addition of 3 atoms of nitric acid—thus, on its explosion, it would be converted into 12 atoms of carbonic oxide, 8 atoms of water, and 2 atoms of nitrogen.

M. Peligot says:—Cotton, on its conversion into gun-cotton, loses
equiv. water, and combines with 3 equivs. nitric acid, and on its decomosition yields 9 C O., 3 C O., 3 N., and 9 H O.

7. Messrs. Dumas, Porrett, and Teschemacher asserted that there were compounds of cyanogen in the guess of pyroxyline.
8. Messrs. Fordos and Gelis state, that the odour which is disengaged during the experiment does not resemble that of prussic acid; and afterwards they forget their first opinion, and conclude by copying other authorities, and say that there is a considerable quantity of cyanic compound in the create.

in the gases.

Now, all I have to say to those chemical gentlemen is this:—Form a jury of 12, agree among yourselves, and then, and not till then, may the public accept your verdict. But, in conclusion, I must add that my invention has nothing whatever to do with chemical analysis, but with mechanical power of the gases; and I must, therefore, for the future decline answering any such arguments, which are evidently irrelevant as to the subject of motive-power which is to be derived from pyroxyline.

I am quite humble about mine own abilities, but for whatever is deficient in me my pyroxyline power is more than able to compensate. My machinery have proved their skill, and that is all I wish to attain—none of your vain glory! My machinery is not corroded by the gases—hence none of your chemical presumptions and suppositions! My machinery works at a cheap rate, and is portable and controlable—none of your cry, therefore, of "Mad dog! mad dog!"

ADDLER COUNT DE WERDINSEX.

THE GUN-COTTON ENGINE.

THE GUN-COTTON ENGINE

SIR,—I might despair at the sight of the long columns brought into the field against me, were I not a true son of the hardy little nation on the shores of the Baltic, just now engaged in warfare against a superiority of numbers; but this being the case, I do not hesitate to take up the gauntlet, and merely supported by a few plain figures and a little plain reasoning, risk a battle against my numerous opponents. In order to consume as little as possible of your valuable space, I will endeavour to be brief, and will, therefore, take the liberty of using in my defence the results furnished by my adversaries. I beg to remark, that my calculation in the preceding

See Philosophical Magazine, Third Series, Vol. xxx, No. 198, January, 1847, pp. 1, 258, 273, 299, 499, 426.

Number of the Mining Journal was only intended to be a rough estimate; and I trust that you, as well as the greater number of your readers, will judge less harshly than Mr. John Curr, of the error I committed in misplacing the specific gravities of the two gases, especially as it by no means affected the result of my calculation.

According to Count de Werdinsky, the total volume of gas generated by the combastion of I cubic inch of gunpowder is equal to from 1000 to 2000 cubic inches, when expanded to the pressure of the atmosphere. As the experiments on gunpowder differ so very considerably, I think that I may assume 1500 cubic inches as a fair average. The count further asserts, that gun-cotton is 3½ times as strong as gunpowder, which, of course, means that I cubic inch of gun-cotton will produce 3½ times 1500, or 5230 cubic inches of gas of the before-mentioned density. As cotton is a vegetable matter, I think that I may assume the specific gravity of compact gun-cotton matter to be equal to the mean density of woods—viz.: between 1933 and 530—say 930. If so, I blo of gun-cotton would contain 30 cubic inches, and the volume of gas generated by the explosion of this quantity would be equal to 90 cubic feet, if the gas and the surrounding bodies were kept at the temperature at which the gases are generated, or something like 2500° Fair. You will perceive, that even then the proproducts of the explosion are but equal to half the volume of steam obtained by burning i he same weight of coal, and that, consequently, they possess but half the power; but, I think, it is altogether out of the question to keep a receiver, destined to resist an enormous pressure, or any other of the acting parts of the engine, at a temperature near the melting point of cast-iron; and I, therefore, beg to reduce the 90 cubic feet of gas from to keep a receiver, destined to resist an enormous pressure, or any other of the acting parts of the engine, at a temperature near the melting point of cast-iron; and I, therefore, beg to reduce the 90 cubic feet of gas from the temperature of 2500° to that of 400°, as being, in my opinion, the utmost heat to which, at least the moving parts of, any machinery may with safety be exposed. All gases, as the experiments of Gay, Lussac, and Dalton, have proved, expand, uniformly about \$\frac{1}{480}\$ the of their volume for every degree Fahr., and heating the mixed gases from 400° to 2500° has, consequently, expanded their volume \$\frac{2}{480}\$, or \$4\frac{2}{8}\$ th times; reducing them again to 400°, we get 48 ths, or nearly 20 cubic feet, which, I think, agrees

again to 400°, we get \$\frac{90}{64}ths, or nearly 20 cubic feet, which, I think, agrees tolerably well with the rough estimate in my first letter.

I will leave the Count Wordinsky's son, or any other "lad," to correct his calculation for driving a carriage. I only beg to remark, that the count quite forgets to consider the length of stroke of his pision (which, by-the-bye, from the datas given, seems to be I foot), and, consequently, the volume of gas consumed for each revolution. This calculation appears, in fact, to be rather confused, and I trust will not make many "believers" among engineers. A simple statement, in plain figures—how many cubic feet of gas, at a practicable temperature, can be obtained from a given weight of gun-cotton—would probably be the best means of convincing practical men; and I shall certainly be most ready to confess my error, if the count succeeds in proving any mistake on my side.

Mr. John Curr is always so particular in impressing upon his readers the fact of his superior ingenuity, that I hardly dare advance anything against such an authority. I beg, however, to draw his attention once more to the "imposing and elaborate series of experiments," conducted by MM. Dulong and Arago; he will then, probably, on the head of the table, observe the following note:—The steam is supposed to be in contact with the fluid from which it is generated, expands uniformly \$\frac{1}{480}\$th of its volume for every degree Fahr, as above mentioned.

I think this will overthrow Mr. John Curr's calculation. I certainly do

abere mentioned.

Ithink this will overthrow Mr. John Curr's calculation. I certainly do not pretend to possess much experience in chemistry; however, I venture to say that Mr. Radley's theory of the processes going on during the explosion of gun-cotton is decidedly wrong. If hydrogen, carbon, oxygen, and nitrogen, are fixed together at a high temperature, the hydrogen and oxygen, no doubt, will combine to form water; if any oxygen is left, it will convert the earbon into carbonic acid (or carbonic oxide), and, most likely, the nitrogen will form no combination at all. The result of Mr. Radley's calculation appears to differ considerably from mine, but, in fact, it agrees very near with my estimate. According to Mr. Radley, 208 lbs. of gun-cotton produce 3040 cubic feet of gas, or 1 lb. (say) 15 cubic feet, of 60° Fahr. which, at 400°, Fahr., would expand to about 23 cubic feet. **London**, April 28.

THE GUN-COTTON ENGINE.

THE GUN-COTTON ENGINE.

SIR,—The data furnished by "E. M. L.," of Ougrée, in to-day's Mining Journal, enables me to estimate the power to be derived from the combustion of gun-cotton, assuming that the temperature of the atmosphere at the time of Schmidt and Hecker's experiment was about 60° Falu, or exactly 16° C, and also that its pressure was 15 lbs. on a square inch, as follows:—

A gramme being '0022 lbs. ayoirdupois, and a cubic centimetre '061 cubic inch, and 1728 cubic inches I cubic foot—

 $061 \times 588 \times 0022$ = about $9\frac{1}{2}$ cubic feet of gas produced from 1 lb. of gun-

cotton when at 16° C. Taking the temperature of the gas when in action on the piston at 406'4° Fah. (which differs little from the temperature assigned by Mr. Hanssen), or 208° C— 208 \4

 $(\frac{1}{16})$ × 144 in. × 15 lbs. × $9\frac{1}{2}$ ft. =17,587 horses, the power of the gas

33,000 acting on the piston per minute, on condition that 1 lb. of gun-cotton be expended per minute, and estimating the clastic pressure of the gas in agreement with the experiments of the Academy of Sciences of Paris on steam. Taking gun-cotton at 8d. per lb. and coal at 6d. per bushel, allowing a tenth of a bushel per hour for each horse's effective power, and assuming that one-half the power of the gun-cotton is expended on friction, &c., the comparative cost will be as follows:—

8 × 60 × 10 × 2

 $\frac{60 \times 10 \times 2}{40}$ = 40*l*, in 10 hours—the expense of gun-cotton.

 $\frac{17,587 \times 6}{240}$ = 4394 in 10 hours—the expense of coal.

Of the effects of xyloidine on iron, or other metal, I have no experience Upper Penton-street, May 5. John Curr.

WONDERS OF LOCOMOTION—NEW MOTIVE POWER.

Sire,—From reading the correspondence which has appeared in the two last Numbers of the Mining Journal, I am induced to offer a few remarks upon Count de Werdinsky's "Wonders of Locomotion." For this purpose I shall make use of the materials furnished in the letters of Mr. Hanssen, Mr. Radley, and the count, as from such materials we may arrive at a sufficiently accurate conclusion for practical purposes. Mr. Hanssen sets out by stating that I lb. of coal will convert as much water into steam as, at an atmospheric pressure, would be in volume 212 cubic feet; so far he is undoubtedly right. Mr. Radley's analysis of gun-cotton gives 28 cubic feet as the volume due to the elementary gases in their uncombined state, as 60° Fah., and at an atmospheric pressure; and when in their resultant state, after explosion and recomposition, his analysis gives 15 cubic feet of gas at the same temperature and pressure as above, as that due to I lb. of gun-cotton. The count has spent most of his argument upon the mere dilation of the gases by the heat evolved in the explosion of the cotton; and he lays much afrees upon an hypothesis of his, that the elementary substances exist for an appreciable time in an isolated or uncombined state. I am apt to think that some of our best chemists are of a different opinion more than the same to the state of our promised state. WONDERS OF LOCOMOTION-NEW MOTIVE POWER. to think that some of our best che

stances exist for an appreciable time in an isolated or uncombined state. I am apt to think that some of our best chemists are of a different opinion upon this point, and deem it more probable that the transition of the elementary substances from the one-compound state to the other is instantaneous, and stand in the relation of cause and effect to each other.

But be this as it may, I will give the count the benefit of the doubt (if any there be) upon this point; and take the elementary gases resulting from 1 lb. of gun-cotton as 28 cubic feet at 60° Fah. Adding to this their increased volume at 212°, which is the temperature of steam at an atmospheric pressure, I found the volume of these elementary gases would be 38 cubic feet, which is the relation they bear when considered at the same temperature and pressure as the steam generated by the 1 lb. of coal—so that 1 lb. of coal gives 212 cubic feet of steam and 1 lb. of gun-cotton gives 38 cubic feet of elementary gases, each of an atmospheric pressure and 212°. If we take the resultant gases, which we have seen are only 15 cubic feet, at 60° Fah., we find, at a temperature of 212° Fah, that they would be increased in volume to 20 cubic feet—so that in this case we have the 1 lb. of coal, as before, producing 212 cubic feet of steam; and tha 1 lb. of gun-cotton producing resultant gases, after explosion and recomposition, equal to only 20 cubic feet, at the same temperature and pressure as the steam.

he bestowed a little more thought upon the matter, he would have discovered that steam possesses all the adaptations which any other gas does for being dilated by heat; and that was it desirable so to dilate it by such high temperatures, it can be done with little or no greater consumption of coal; but the count will find, if he reduces his scheme to practice, that such high temperatures are objectionable. The practical view of the matter is, as it appears to me, when viewed in relation to £s. d., that upon the supposition that the gases can be employed under such circumstances in their elementary state, the cost of equal amounts of power would be, that from gun-cotton we should have to pay 100s. for that which, by the aid of coal and steam, we can obtain at less than 1s.; and if the gases should be too quick in their recomposition (as I anticipate they will) for the count to catch them in their uncombined state, then the user of gun-cotton will have to pay nearly 200s, for that which coal and steam would supply at 1s. It is a pity Mr. Curr had not taken a little more pains to inform himself upon the relation of temperatures and pressures before he had written his letter upon this subject.

Thomas Craddock,

Birmingham, May 2.

THE XYLOIDINE ENGINE.

THE XYLOIDINE ENGINE.

Birmingham, May 2.

THE XYLOIDINE ENGINE.

Str.,—I venture to say, that had Count de Werdinsky been aware that two other letters—that of "Azotus" and "E. M. L."—were so closely to follow his own last communication, he would, from prudent motives, have withheld its insertion. The letters in question were of themselves such an able refutation of the count's fallacious statements, as well as a confirmation of my own, that I should have thought it unnecessary to have trespassed again in your columns upon the same subject; but, Sir, I feel bound to do so, inasmuch as the count appears wanting in truth and candour, notwithstanding he professes to be an admirer of fair play and fair argument. The count says, "as there is no pleasure without its alloy of pain, it is now my unpleasant duty to correct here the misropresentations of Mr. J. Horsley, in reference to the cause of oxidation of fire-arms." I certainly thank the count for offering to become my tutor; but wherein am I wrong? What correctons are needed? What misrepresentations have I made? Surely every sensible man can easily perceive that the count, instead of being able to teach others, requires himself faits to be taught.

Now for his candour. I never assigned any reason for the exidation of fire-arms, save and except when gun-cotton was used; I nowhere mentioned the effect of gunpowder, steam, or any other power, as the count represents. Really, Sir, the count has not met my question fairly. I simply asked him, since ultric acid is used to impart explosive properties to the cotton, what becomes of the nitrogen?—While his cannot be a properties to the cotton, what becomes of the nitrogen?—While his cannot explain, and a good reason why, because his hnowledge of the matter is of a kin with his strange idea of hydrogen gas being given off from the extron contained in purpowers as a sention; for gunpowder, as however, the most of the count and the properties to the cotton, what becomes of the nitrogen terms.

Again, to use the count's own words—"Poor gan-cotton,

THE NEW MOTIVE-POWER (?)

THE NEW MOTIVE-POWER (?)

Sin,—As the Count de Werdinsky is pleased to say that the evolution of nitrous acid gas in the discharge of gun-cotton is chargeable as a fault on Mr. Horsely's "mode of preparing that explosive substance," may I be permitted to ask whether, as intimated by Mr. Horsely, the count availed himself of the gun-cotton prepared in Dr. Ure's laboratory by Mr. Horsely? Your able correspondent of Liege has satisfactorily accounted for the formation of nitrous acid gas, as a product of the explosion of gunction. A more intractable and dangerous substance cannot well be conceived of; and I have only to add, in corroboration of Mr. Horsley's conclusion, that, by firing gun-cotton in the hand, and in contact with the skin, the skin has been stained yellowish, from the nitrous acid evolved; and that not only from the gun-cotton prepared by Mr. Horsley, but that of Schöubein and others.—J. Murray: Portland-place, Hull, May 7.

ANTHRACITE.

SIR,—When I incidentally, on a former occasion, referred to carbonic acid gas and carbonic oxide as the exclusive products of the combustion of stone-coal, I of course referred to anthractic as such—not to any extraneous matters with which it may be accidently contaminated, such as sulphuret of iron, &c., being quite aware that it is not unfrequently met with so impregnated; and the fatal effects then referred to seemed to me more likely caused by these two gases, though it may be aggravated by the presence of sulphurous acid gas.—J. Murray: Hull, May 7.

DEANE'S DIVING APPARATUS.

Str,-You some time ago referred to the application of a modification of Deane's diving apparatus for the purpose of encountering conflagra-tion. The principle of Deane's apparatus, so successfully employed in re-ference to the submarine wreck of the Royal George, beyond all doubs, originated with me, and was brought before the public long before Deane originated with me, and was brought before the public long before Deane adopted it. The recommandation was promalgated in consequence of a case of drowning in Yorkshire, where, from the delay in recovering the body, the means of restoration proved ineffective. The proposal was simply this:—An air-tight hood was supplied with goggles for vision; a flexible pipe from above allowed the expired and heated air to ascend and escape; and it might be floated by cork, &c., or otherwise rendered bouyant on the surface of the water; while a condenser, as a terminus to another pipe, supplied the hood with pure air.—J. MURRAY: Hull, May, 7.

ACTION OF THE SUN'S RAYS ON A STEEL BALANCE.

ACTION OF THE SUN'S RAYS ON A STEEL BALANCE.

Sin,—The phenomenon recorded by your ingenious and observant correspondent, "H. E.," is a most interesting one, and eventually may lead to results more important than may now be contemplated. I am thereby reminded foreibly of the old experiment made with a view of proving the materiality of light. A delicate vane was sensitively poised on a point, and enclosed in a glass case, in order to preserve it intact from the undulations of atmospheric air. The concentrated rays of light were, by means of a lens, directed to the vane, when it began to move, and, if I mistake not, the rate was uniform. I do not mean, however, to say that the experiment proved the materialism of light, or that there is a parallelism in the case before us.

the case before us.

I can have no doubt that the curious phenomenon now referred to has to do with the electro-magnetism of the solar light, and is more nearly allied to Dr. Faraday's discovery of the circulation of a magnet round a sun-beam, and vice versa, than may be at first sight imagined. The temporary, it may be, magnetism imparted by the solar rays to the steel baan orbital revolution. The experiments of Signor Marrichin and Mrs. Sommerville corroborate this view of the case. I remember to have observed the effects of the activism of the sun's rays curiously developed on the summit of the Leaning Tower of Pisa. That portion of the iron rail at the summit longest exposed to the action of the sunbeam was much oxidated, while the other portion was comparatively but little affected.

Hall Man 7. J. MURRAY. Hull, May 7.

ACTION OF THE SUN'S RAYS ON A STEEL BALANCE.

ACTION OF THE SUN'S RAYS ON A STEEL BALANCE.

SIR,—With your permission, I beg to offer a few remarks on the letter of your correspondent, "H. E.," relative to the motion of his assay based to call the same and the same and 1 lb. of gun-cotton producing resultant gases, which we have seen are only be increased in volume to 20 cubic feer—so that in this case we the I lb. of coal, as before, producing 212 cubic feet of steam; and lb. of gun-cotton producing resultant gases, after explosion and resistion, equal to only 20 cubic feet, at the same temperature and me as the steam.

The ordinary expansion of the steel beam radiates, by absorption, that imponderable substance within the glass case. The ordinary expansion of the steel beam from the heat of the sun, I think quite sufficient to produce the action resistion, equal to only 20 cubic feet, at the same temperature and me as the steam.

The ordinary expansion of the steel beam from the heat of the sun, I think quite sufficient to produce the action resistion, equal to only 20 cubic feet, at the same temperature and me as the steam.

The ordinary expansion of the steel beam from the heat of the sun, I think quite sufficient to produce the action resistion, equal to only 20 cubic feet, at the same temperature and the count's argument, based upon the great dilation of the steam.

Other causes than those I have alluded to—situation, &c.—may assist in producing the motion.

Other causes than those I have alluded to—situation, &c.—may assist in producing the motion.

Other causes than those I have alluded to—situation, &c.—may assist in producing the motion.

room in which an accurate assay balance is to be used should not exceed 62° Fahr. There are evils attending the use of steel beams for assay purposes, as their accuracy is very questionable after a little use; they acquire a degree of polarity, quite sufficient to affect their correctness, and, therefore, should not be used where great accuracy is required. Oxidation is another evil to which they are subject. Ordinary gun-metal has been found to answer well for beams used in assaying where great nicety is required, when provided with proper bearings. I need remark that, of whatever metal the beam is constructed, it requires the greatest care, both in the use and keeping, to ensure correctness.—W. B.: London, May 7.

P.S.—The assay balance, when not in use, should not be allowed to rest, or vibrate, on its bearings, and it should be kept from the light as much as possible.

nuch as possible

ACTION OF THE SUN'S RAYS ON A STEEL BALANCE.

ACTION OF THE SUN'S RAYS ON A STEEL BALANCE.

Sir,—Observing in your columns of last week a letter from a correspondent, asking for an explanation of the cause to which is to be attributed the playing of the beams of his assay scales, I would submit as a solution to his inquiry the following; at the same time, I do not pledge myself that such is the real cause, but may, I think, account for it, and, at least lead to further inquiry and investigation. It is questions of this nature which appear to me well calculated to render your Journal valuable to scientific men; and as we well know the greatest results oft are arrived at from the most simple observations, so the elucidation of a subject of interest, in a scientific point of view, may possibly lead to a chain of inquiries and results tending to the advancement and promulgation of science. It would appear to me, according to the letter of your correspondent, that the balance is placed in a position true south—that is to say, with the line of the beam east and yest. Now, the action of the sun is, in my opinion, simply the heat concentrated by its rays, which rarefying the air in the enclosed case in which the scales are placed, the air so confined makes a circuit, and thus keeps the scales in continuous action; while on the withdrawal of the sun's rays, and consequent heat, the beam naturally is redrawal of the sun's rays, and consequent heat, the beam naturally is restored to its former repose, or state of rest. I merely submit this as one of the many communications you may receive on the subject.

OFFICES No. 41, MOORGATE-STREET

The transactions of this office extend to all business connected with, or in any way dependent on, the contingencies of human life; and the company affords to persons assuring the combined advantages of rates of premiums as low as can be safely taken—methods of assurance which oblige the assured to pay only for so much protection as he requires, and the consecution and arrangement with the "Union" Fire and Life Assurance Society, which is one of the oldest existing offices (having been established in 1714), and now possesses a large accumulated capital.
Policies granted on the lives of members of building societies, to secure the payment

rangement with the "Union" Fire and Life Assurance Society, which is one of the oidest existing offices (taying been established in 1714), and now possesses a large accumulated capital.

Policies granted on the lives of members of building societies, to secure the payment of such subscriptions as may become due after their death.

Assurances for the whole of life, at little more expense than temporary assurances can be effected in this office, by annually increasing premiums.

Participation in profits to the extent of four-fittis by those assurance may have been deellned by other offices, assured at premnums carefully adjusted to the increased risk.

Policies granted for sums of money payable upon the assured attaining any specified age, or their antecedent death, and for annutites, immediate, deferred, or contingent.

Loans (repayable by instalments, ceasing however at the decease of the borrower), upon any description of assignable property of adequate value, upon the policies of the company, or on approved personal security.

Policies for terms of years, or for the whole of life for any sum not exceeding £5000; and premiums payable in one sum, annually, inif-yearly, quarterly, or monthly, so that the various plans of this company are available to all classes. Every facility consistent with the security of the company for the payment of premiums by policy holders at their convenience, and policies can at any time be surrendered for their full value; thus affording the greatest advantage for the deposit and investment of money.

A liberal commission allowed to solicitors, secretaries of building societies, and others introducing business. Agents wanted in all the principal towns, where none have yet been appointed.

Detailed prospectures, with tables, as well as any further information, can be obtained on application to

The GUTTA PERCHA COMPANY beg to bring under the notice of Mine Owners,
Manufacturers, &c., the GREAT SAVING, both of time and expense, which is effected
by the use of the GUTTA PERCHA PUMP BUCKETS and VALVES. These Buckets
may be had of any size or thickness, without any seam or reised-joint. They are unaffected
by acids, alkalies, &c. Cold water will, never soften them, and they are, consequently,
much more durable than leather, and also cheaper. The most gratifying testimonials
have been received from millowners, who have had these Buckets in operation for several months past, without the slightest repairs being required.

GUTTA PERCHA TUBING

Being so remarkable a CONDUCTOR of SOUND, is now being extensively applied for

Being so remarkable a CONDUCTOR of SOUND, is now being extensively applied for CONVEYING MESSAGES from ONE BUILDING, or PLACE, to ANOTHER. If a Tubing of this material, I inch diameter, be carried from the mouth of a mine, or pit, down the shaft, to various parts of the mine (no matter whether a quarter or half a mile distant), an instant communication may be established by means of the whistle, on Whishaw's principle, and a conversation carried on as distinctly as though the parties were but a few feet from each other. When these Tubes are in general use, they will greatly leasen the loss of life in mines. but a few feet from each other. When these trues are in general leasen the loss of life in mines.

Continue to secure a continually increasing demand; they can be had of any size or longth. Their durability and strength, permanent contractility and uniformity of substance, their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water, and the facility with which the only joint required can be made in bands of from 200 to 300 feet long, render them superior for almost all working purposes, and decidedly

GUTTA PERCHA Soles for Boots and Shoes, Bowls, Buckets, Picture Frames, Brackets, Monddings, Surgical Instruments, Vases, Cups, Inkstands, Balls, &c., may be had at the Company's Works, Wharf-road, City-road, London, or of any of their wholesale dealers in town or country.

SIR JAMES MURRAY'S FLUID CAMPHOR.—This correparation is infinitely more effectual and to than Camphor, either in substance or suspensional and the company of the compan mixtures. This permanent solution is safe and agreeable to all; it raises the spirits, renevates the powers of life in low fevers, abutes spasms, allays irritation of the stomach and nerves, and is the best verificile for tonics and sodutives in diarrhoad dysentery. As a warm restorative it is invaluable; and is of use in sea-sickness, fainting, and billous complaints. This ORIGINAL FLUID CAMPHOR (containing 3 grains of earnphor to the ounce) is sold by the sold consignes, Mr. William Balley, of North-street, Welverhampton, and all wholesale and retail drugglets and medical agents throughout the British Empire, in bottles, at 1s., 2s., 4s., and 8s. each, with directions for use.

Also, Sir JANES MURRAY'S FLUID MAGNESIA, in bottles, at is., 2s. 6d., 3s. 6d., 5s. 6d., 1ts., and 2ts. each.

The ACIDULATED SYRUP, in bottles, 2s. each. EATING'S COUGH LOZENGES.—Upwards of 40 years' experience has fully confirmed the superior reputation of these Lozenges, in the oure of Asilma, Winter Congh, Hoarseness, Shorteness of Breath, and other Pulmonary Maladies. They have deservedly obtained the high patronage of their highestes the King of Frussia, and the King of Hanover, very many also of the Nobility and Ciergy, and of the public generally, use them, under the recommendation of some of the most entimate of the faculty. They have immediate influence over the following cases:—Asthmatic and Consumptive Complaints, Coughs, Shortness of Breath, Hoarseness, &c.

Prepared and sold in boxes, is, 14d., and tins, 22.9 2d., 4s. 6d., and 10s. 6d. each, by Thomas Keating, chemist, &c., No. 79, St. Paul's Churchyard, London, retail by addruggists and patent modicine vendors in the kingdom.

Church street, Folkestone, No., 6eanist of this town, for some relief; he recommended me your "Cough Lozenges," which, I am happy to say, cured, me in a week. They most confiding to the Cough Lozenges," which, I am happy to say, cured, me in a week. They most confiding to recommend them, and beg you will not besistate to make bilistic public; suck a valuable remedy cannot be too highly recommended.

SCHOOL OF MINERALOGY, CHEMISTRY, AND

GENERAL SCIENCE.

MESSRS. NESBIT'S ACADEMY.

No. 38, KENNINGTON-LANE, LAMBETH, NEAR LONDON.

In this SCHOOL, in addition to all the branches of a good education, EVERY FACILITY AFFORDED for obtaining a knowledge of ANALYTICAL CHEMISTRY and ATURAL SCIENCE, as applied to the Arts, Manufactures, and Agriculture.

The pupils are practically taught in the Laboratories, which are fitted up with every seenful for the most extensive chemical investigations.

Mr. Nesbit's works on Land Surveying, Mensuration, Gauging, Artimetic, English arsing, &c., may be had of all bookeellers.

References.—Dr. D. B. Reid, F.R.S.E., &c., House of Commons, Westminster; R. Prosser Seg., C.E., Birmingham; J. L. Bullock, Eag., Editor of Freezieur's Chemical Analysis, bonduit-street, Regent-street; J. Gardner, Esq., M.D., Editor of Liebig's Leiters, &c., fortimer-street, Portland-place; and W. Shaw, Esq., Strand, London.

The POCK ET

BOOK - KEEPING (Price Eighteenpence).—The POCKET GUIDE TO COMMERCIAL BOOK - KEEPING, a Practical Treatise on Merchants' counts, by single and double entry, according to the latest and most approved systems.

By Professor WALLAGE.

Accounts, by single and double entry, according to the latest and mass approximately shaped and double entry, according to the latest and mass approximately entropy and the expositions of the principles and practices of commercial book-keeping, the "O' all the expositions of the simplest, the clearest. Nothing is put down but what is absolutely needed; yet it embraces everything useful in the science. The definitions are clear and comprehensive—the exposition succinct and perspicuous, and the plan quite unique."—Berwick Warders.

The attention of teachers is specially requested to this admirable little treatise—at one-commercial to the price of any other complete book on the subject; it gives us all that is necessary to initiate the student into a thorough knowledge of the science. At the suggestion of several teachers, who have adopted it as their class-book, it is now strongly bound in the state.

MATHEMATICS (Price Eighteenpence).—The PRACTICAL MATHEMATICIANS' POCKET GUIDE; a set of Tables and Logarithms of Numbers, and of Logarithmic Sines and Tangents, with other useful Tables for Engineers, Surveyers, Mechanics, &c.—By Professor Wallack.

"We call the attention of our readers to this little volume with peculiar pleasure. It as paramount claims to our recommendation."—Scotz Times.

MECHANICS (price Eighteenpence).—The PRACTICAL ECHANICS (price Eighteenpence).—The PRACTICAL ECHANICS POCKET GUIDE: containing Rules and Tables for calculating the Worker geffects of prime moving machinery—of the strength, resistance, and pressure of marials, with tables of the weights and cohesive strength of iron and other metals; and elements of machinery, including the mechanical powers, with practical examples dillustrations.—By Professor Wallace.—Dedicated to Robert Napier, Esq., Vulcan under.

nce or literature have we met a more truly us

ENGINEERING (Price Eighteenpence).—The PRACTICAL NGINEERS' POCKET GUIDE, a Consise Treatise on the Nature and Application of chanical Forces, the Action of Gravity, the elements of machinery, &c., with a variety rules and tables, of the greatest use to engineers and mechanics in general.—By Pro-

MENSURATION, &c. (Price Eighteenpence).—The UNIVER-L. CALCULATORS* POCKET GUIDE,—a Companion to every Set of Mathema-al tables, showing their construction and application of arithmetic, mensuration, trigo-metry, surveying, navigation, astronomy, &c.—By Professor Wallace.

COMMERCIAL (Price Eighteenpence)—The MERCHANTS'
IND BANKERS' COMMERCIAL POCKET GUIDE, being a Manual of the Principle'
Banking, Broking, Fairs, Foreign Coins, Foreign Exchange, Insurance, Market Prices,
ublic Funds, and Commercial Transactions in general. Dedicated to Alexander Goodr, Eaq., Secretary to the Britist Linen Bank.
Published by W. R. M'Phun, Argyle-street, Glasgow; A. Hall and Co., London; and
ay be had by order of all booksellers.

BR. LOCOCK'S FEMALE WAFERS have no taste of medicane, and are the only remedy recommended to Females.—Price is. 14d., 2s. 91., and IIs. per box.—Brwars or instrations: Unprincipled persons counterfeit this medicine in the form of "pills." &c. Purchasers must, therefore, observe that none are genuine but "wafers," and that the words "Dr. Locock's Wafers," are in the stamp outside each box.—Ossensy: Several of the counterfeit medicines have words on the stamp as nearly resembling these, as to mislead the unwary. Purchasers must, therefore, strictly observe the above caution.—Acaptus: Da Silva and Co., I, Bride-lane, Fleet-street, London; soid by all medicine vendors, of whom also may be had Dr. LOCOCK'S "PULMO-MIC WAFERS," for asthma, consumption, coughs, and colds.

PRELIMINARY ANNOUNCEMENT.

AD ELAIDE MINING ASSOCIATION, SOUTH AUSTRALIA.

"It needs no prophetic split its forsted that, in a very few years, the uniting interest of South Australia will be a brandable rival to all other competitors, whether European or foreign. There is no sate promising or legitimate field for the supplement of British capital as South Australia bilds promising or legitimate field for the supplement of British capital as South Australia bilds promising or legitimate field for the supplement of British capital as South Australia bilds promised to a proverb, can be anticipated to eloud the sin of property which has just rice over our knowled province."—Joshov's South Australia and none of the canese which made must of the South American and other british of the control of the canes which has been been found, in many instances, close to the surface, and aimsed in every directions throughout the colony, in losis of extraordinary augnitude working of some of the numerous copper and other metallic miseral deposite of South Australia. These deposits have been found, in many instances, close to the surface, and aimsed in every directions throughout the colony, in losis of extraordinary augnitude many be assisted for shippoints to England, while those of an inferior quality may be smitted on the upok, and the produce find a ready sale for the Indian market.

An one of the surface of

The strictest regard to economy, commissions was proposed, for the purpose of reporting ings of the directors.

Half-yearly meetings of the shareholders will be convened, for the purpose of reporting the proceedings of the directors, and the state and prospects of the undertaking.

It is proposed to submit to the consideration of the board of directors, now in course of completion, the above sketch as a basis for a prospectus, which will be duly issued; in the meantime, communications may be addressed to James Parker Penny, Esq., at the temporary offices of the company, 52, East Cheap; or at Messra. Jones, Blaxland, and Jones, Crosby-square, London, proposed solicitors to the company.

DATENT ALKALI COMPANY'S METALLIC PAINTS

These paints (the products of a patent process), possess peculiar and valuable properties not otherwise attainable, and are perfectly free from the deleterious qualities of white-lead. They surpass all other paints ever yet discovered in point of DURABILITY and ECONOMY; two coats being more than equal to three of any other description. From their chemical composition, they are pre-eminently adapted for covering IRON; also STUCCOED or BRICK BUILDINGS, and svery kind of WOOD WORK. The process by which the base of these paints is produced, makes it impossible that any change should take place in their composition from autospheric influence. Their identity with two by which the base of these paints is produced, makes it impossible that any change sho take place in their composition from atmospheric influence. Their identity with secures them from galvanic action, so fatal to the durability of lead and other paints

secures them from galvanic action, so main to the station of sea water, and of the sulphureiron work.

They have been exposed on SHIPPING to the action of sea water, and of the sulphureited hydrogen so prevalent in sea ports and tidal harbours, for more than THREE YEARS, without change.

Their CHEAPNESS and STEENGTH render them pecularily eligible for IRON BRIDGES, ROOFS, and RAILINGS, FARM BUILDINGS, and SHIPPING.

The attention of the SHIPPING INTEREST is particularly directed to the company's patent compound metallic BLACK PAINT (the only metallic black paint of any value in existence), which will be found to act as a most valuable preservative when applied to iron steam-boats, and wooden vessels. It also forms a beautiful covering for STOVES, and is susceptible of a high polish.

existence), which will be found to act as a most valuable preservative when applied to iron steam-boats, and wooden vessels. It also forms a beautiful covering for STOVES, and is susceptible of a high polish.

Several imitations of the Patent Alkali Company's paint having been sold under the name of IRON PAINT, the directors of the company degm it necessary to caution the public that no other iron paint is genuine, or partakes in any degree whatever of the properties of the company's paints, the base of the latter being obtained solely by a series of processes, which are protected by the company's patents, and to which alone is owing their extraordinary body, or covering power. Numerous and most satisfactory testimonials have been forwarded to the company's offices, copies of which may be had of the secretary or of the agents.

or of the agents.

Price, by the ton, £25, delivered in London or Liverpool, exclusive of packages.

To be obtained exclusively on application to the secretary, Mr. J. A. West, at the offices of the company, 20, Fenchurch-streel, London; or of any of the undermentioned parties, who are the only agents of the company:—

Mesars. Evans Brothers, London; Mesars. Matthews and Leonard, Bristol; Messrs. Evans and Hodgson, Exeter; Messrs, Clarke and Fill, Yarmouth, Norfolk; Mr. D. Sandeman, Glasgow; Mr. G. Sandeman, Dundee; Mr. R. Nowby, Bradford, Yorkshire, Mr. R. S. Farr, Edinburgh; Mr. W. Bailey, Wolverhampton; Messrs, Vint and Co, Nowcastle-on-Tyne, and Sunderland; Mr. Robert Oxland, Plymouth; Mr. Joshua Fox, Tregedna, near Falmouth.

MERSON'S PATENT LIQUID CEMENT is ready for use, is simple in its application, and only ONE-EIGHTH the COST of OIL PAINT; for beauty it is pre-eminent over all other materials used on the fronts of houses—giving the exact appearance of FINE CUT STONE; can be used at once on fresh Roman cament or other plastering; is particularly calculated for country houses, villas, or gate entrances that have become solid or dingry, which can be beautified in any weather, at a trifling cost. Sold in casks, of 1, 2, and 3 cwts., at 8s., 15s., and 21s. each.

PATENT MINERAL PAINT.

Invaluable as a COATING for SHIPS' SIDES and BOTTOMS, all kinds of WOOD or METAL WORK, roofing felts, leaky roofs, spouts and gutters, doors, sheds, railing, and all kinds of out-door work, and being perfectly waterproof, will preserve their surfaces from atmospheric influence and decay—requires no preparation, and will dry in a few hours.—Sold in casks, 2 to 50 gallons. Brilliant black, 2s.; rich brown, 2s. 9d. per gall.

BELL, LEAR, & CO., 16, Basing-lane, Cheapside.

BELL, LEAR, & CO., 16, Basing-lane, Cheapside.

NEUBER'S SCENTED LIQUID GLUE, being perfectly transparent, is admirably ADAPTED for LADIES' FANOY WORK, &c. In the control of the control

DELAIDE MINING ASSOCIATION, SOUTH DAMP AND GASEOUS EXHALATIONS.

AUSTRALIA.

All MEMBERS of BOARDS OF HEALTH are especially DIRECTED to the most

All MEMBERS of BOARDS OF HEALTH are especially DIRECTED to the most EFFECTIVE MEANS which they can ADOPT to PREVENT the injurious and often FATAL EFFECTS upon the HEALTH of the COMMUNITY, arising from exhaliations that are produced from moisture, decayed animal matter (as in grave-yards), stagmant water, and collections of feetle the impervious quality of the ASPHALTE of SEYSSEL renders it the most perfect PAVEMENT or COVERING that can be relied upon for hermetically closing, and thereby preventing the rising of moisture and ecape of noxious vapours. The present extensive application of this material for covering reofs, terraces, and arches, for preventing the percolation of well, a strong evidence of its effectiveness for the above purposes, which is further confirmed by the following extract from the lip-port of the Commissioners on the Fine Arts:—

"In 1839, I superintended the construction of a house of three stories on the Last d'Enghein. The foundation of the building is constantly in water, about 19½ inches below the lovel of the ground floor. The entire horizontal surface of the external and interwal walls was covered at the level of the internal ground floor with a layer of SEYS-SEL ASPHAUTE, * less than half an inch thick, over which course sand was spread.

Since the above date, no trace of damp has shown liself ground the walls of the lower.

EL ASPHALTE.* less than half an inch thick, over which coarse sand was spread.

EL ASPHALTE.* less than half an inch thick, over which coarse sand was spread.

Since the above date, no trace of damp has shown itself round the walls of the lower tory, which are for the most part painted in eil, of a grey stone colour. It is well known that the least moisture produces round spots, darker or lighter, on walls so painted. Yet he pavement of the floor, resting on the soil itself, is only about 2½ in. above the external surface of the soil, and only 19½ in., at the utmost, above that of the sheet of water.

The layer of Asphalte having been broken and removed, for the purpose of inserting he alls of two doors, spots indicating the presence of damp have been since remarked at he base of the door-posts."

* This method has been adopted at the new Houses of Parliament.

Seysel Asphalte Company, Stangate, London.

I. FARRELL, Secretary.

PATENT RAILWAY AND OTHER CARRIAGE AXLES,

PATENT RAILWAY AND OTHER CARRIAGE AXLES,

PATENT SHAFT AND AXLE-TREE COMPANY,

BRUNSWICK IRON-WORS, WEDNESSURY, STAPPORDSHIRE.

The Judicial Committee of the Privy Council having declared that the AXLES

MADE BY THE PATENT SHAFT AND AXLE-TREE COMPANY
had proved a PUBLIC BENEFIT in greatly conducing to the SAFETY of RAILWAY
TRAVELING, the exclusive right to manufacture has been extended for four years, on condition that the practice of charging a moderate price, proved hitherto to have been
purused, should be made imperative.

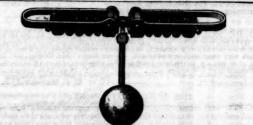

It was also proved that these Axles were in general use—upwards of 100,000 having been supplied to the English and Continental Railways, among whom are the London and North-Western, the Midland, and the Great Western; that they had withstood frequently severe tests applied by the engineers of these railways for the purpose of experiment, and others still more severe to which they were accidentally subjected in use, in one such instance a Patent Axle, 4; timels in diameter, sustained the whole force of a heavy train going at the rate of60 miles an hour, by which it was twisted and bent nearly double, without showing the least fracture.

The patent principle of manufacture causes the axles to be equally strong in all directions, for the "faggot" is made in a cylindrical form, by the external bars being rolled of such a section as to fit accurately around a centre bar. This faggot, however large, is perfectly welded throughout its whole length at one heat, avoiding the necessity of the frequent heating and hammering of the ordinary mode, by which much risk is run of imperfectly welding, burning, and otherwise injuring the iron.

The use of this principle, combined with experience gained of the quality and admixture of the iron and mode of treatment best adapted to resist the strain to which an azie is subjected, enables the Patent Shaft Company uniformly to supply safe axles.

In all cases where the use of the Patent Shaft Company's Axles are specified for, it in respectfully recommended that

exclusively. The trial of the Patent Shaft Company's Iron is solicited in cases where the power to resist agrees strain is of importance. Evidence can be sflorded from several railway engineers, of great economy having resulted from its use, in preventing the breakage to which their coupling chains were frequently previously subjected, particularly on the Midland Railway, where the heavy mineral traffic subjects these chains to unusual strains. Iron manufactured on the patent principle is also recommended for coach and carriage axies, for, if not afterwards injured by the coachsmith, all risk of breakage will be avoided.

WRIGHTON'S PATENT ELASTIC SCREW COUPLING. The PROPRIETORS of this simple and useful INVENTION invite the attention of Railway Companies to the ADVANTAGES and ECONOMY to be derived from its general adoption. The severe tests to which it has been subjected on the Eastern Union Railway fully demonstrate that its application to trucks or goods waggons, with dead draw hooks and solid buffers, produces as perivet and beneficial a result as a complete set of spring traction and buffing apparatus, and at about one-fourth the cost of the cheapest that can be supplied. Its application to passeagur carriages will be found equally beneficial in giving additional case and elasticity to a train, and preventing the symbolic beneficial result attenting and stopping so much complained of. For further particulars apply to Mr. Parsons, Albert-place, Lewisham; or at the Patent Office, 166, Ficet-street.

EXPLOSION AT WHITECHAPEL

TARREST ...

EXPLOSION AT WHITECHAPEL.

HENRY BAKER begs to call the attention of Engineers and Proprietors of Steam-Engines, to his newly-improved STEAM GUAGE, which chrawing annexed. It is an ornament to the engine-room, and supersedes the ordinary Mercurial Guage in these respects, by not being so cumbersome, much cheaper, and warranted accurate. It has been tested at the Polytechnic Institution, London, with attisfactory results; and since the boiler explosion of the Oricket iteam-boat this Guage has been adopted on board the steam-boat plying on the River Thames.

Boiler explosions, in many instances, occur through Steam Guages not being in good working order; therefore, every attention should be paid to these very necessary adjuncts.

THE SCIENCE OF WASHING.—"A New Mode of Washing," says the Maidstone Gasette of January 30, 1849, "which has been advertised by Mr. Twelvetrees, bookseller, has been submitted to us for trial. We have ascertained by careful experiment that the plan pursued is really a great saving. Several persons who have purchased the pamphlet have been so well satisfied with it, that they have who have purchased the pamphlet have been so well satisfied with it, that they have called at our office to suggest that we might do great good, and save much unnecessary labour, by stroagly recommending its adoption by our readers generally, in our scientific column. We do this no sci conscientiously."—The above method is so economical and expeditious, that a FAMILY'S SIX WEEKS' WASH CAN be ACCOMPLISHED BEFORE BEEAKFAST, for less than 6d., without a washerwoman.

Directions to be had only of Harper Twelvetrees, bookseller, 14, New Milman-street, Foundling, London, for 31 stamps and a directed envelope, and of all booksellers.

FOR EVERY HOUSE IN THE KINGDOM.

HARPER TWELVETREES' GENUINE CONCENhour, and is warranted not to injure the finest fabric.—Sold by all chemists and olimen,
in bottles, at 6d., is., and is. 6d. The is. 6d. bottles contain sufficient for 48 gallons of
water, which will boil three lots of clothes, being equal to 144 gallons.

All the leading journals in the kingdom have apoken favourably of this invaluable process, now adopted in most of the infirmaries, asylums, public institutions, and families
throughout the kingdom.

MANUFACTURED only by TWELVETREES, BROTHERS, Ink and Blacking Manufacturers, Millman-street, Bedford-row, London, wholesale and for exportation.

Two thousand more agents wanted.

Sold wholesale by Barclay and Sons, Satton, Edwards, Hansey, &c.

No Chemical or Potash preparations are introduced, which are notoriously injurious
to linen.—MANUFACTORY—MILLMAN-STREET, BEDFORD-ROW, LONDON. FOR EVERY HOUSE IN THE KINGDOM
